

Building a Storage Cluster on-top of Kubernetes

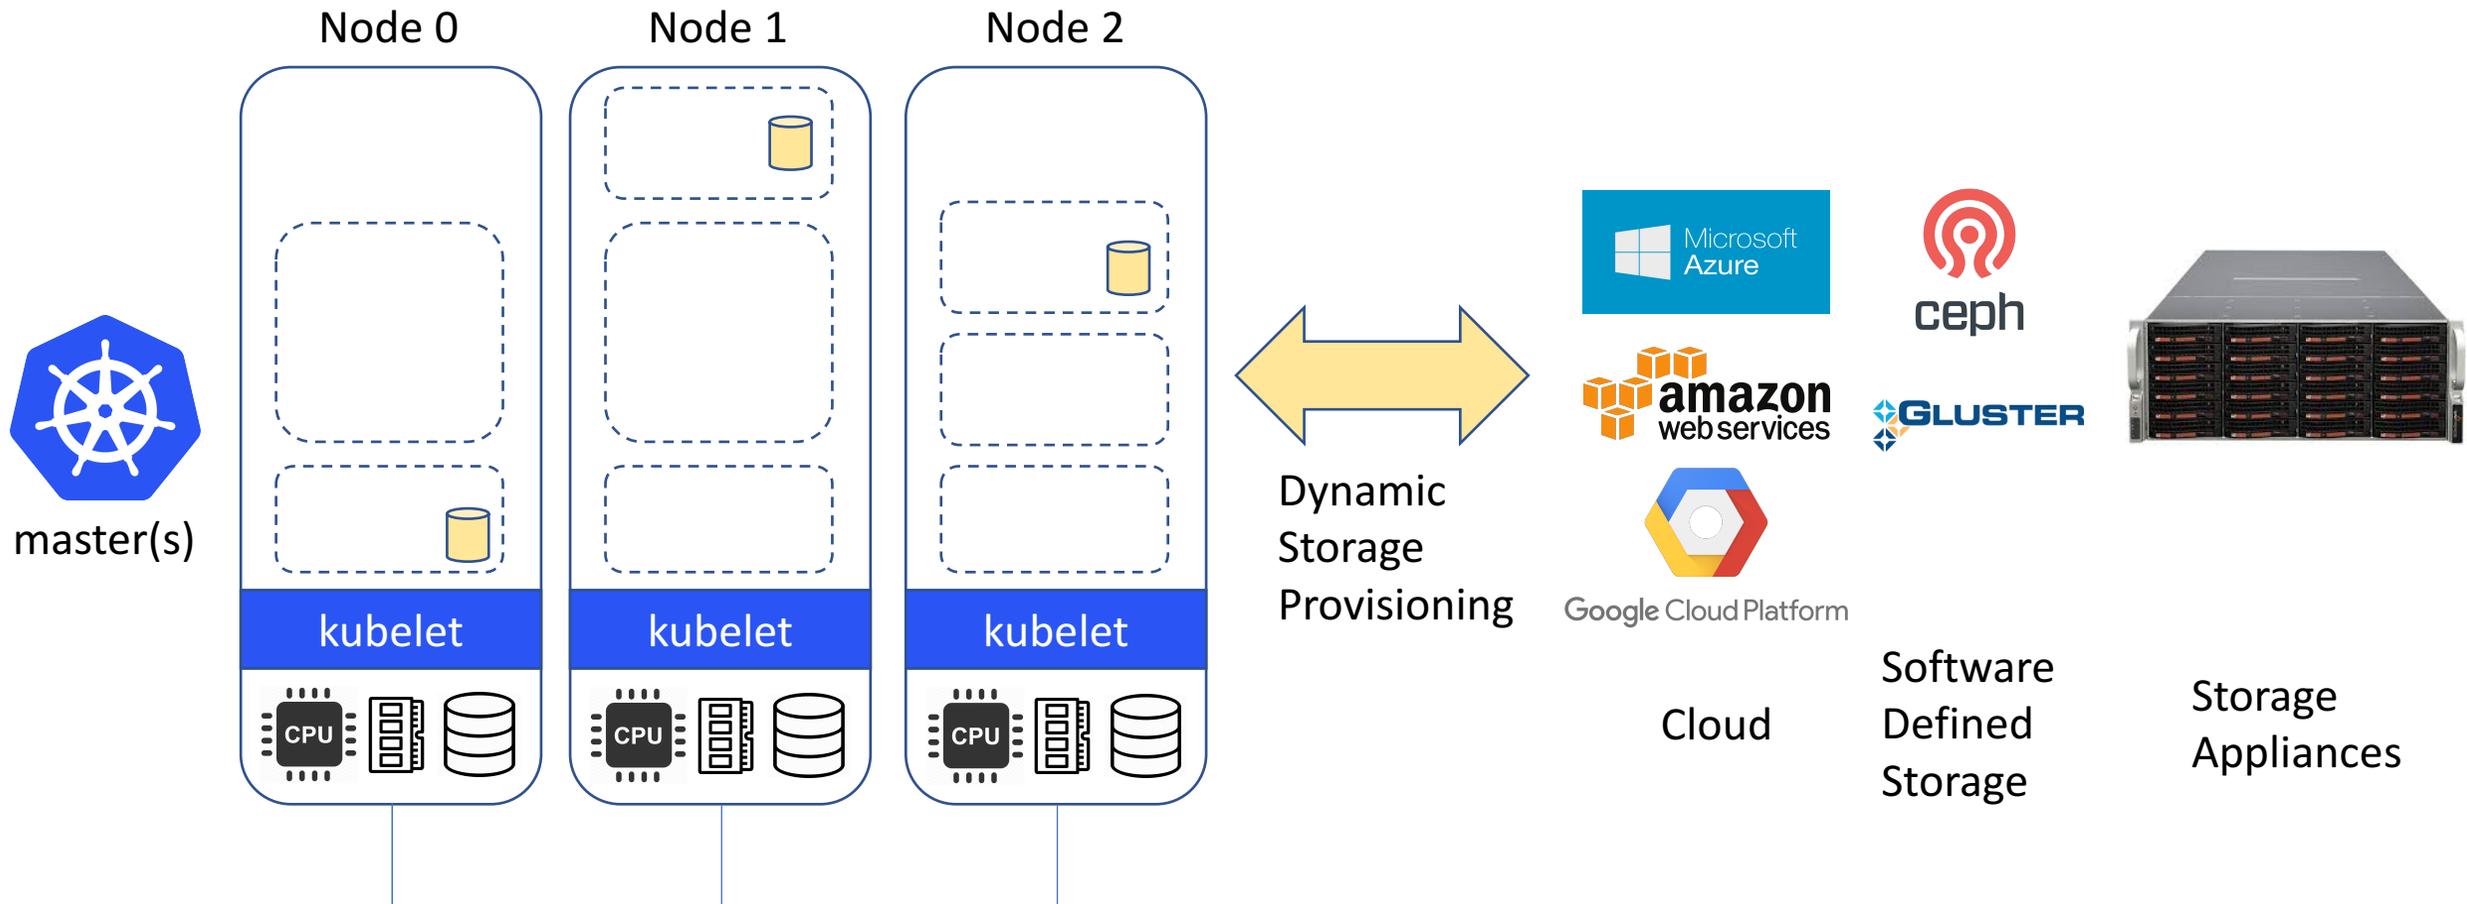

Bassam Tabbara (@bassamtabbara)

CTO @ Quantum Corp.

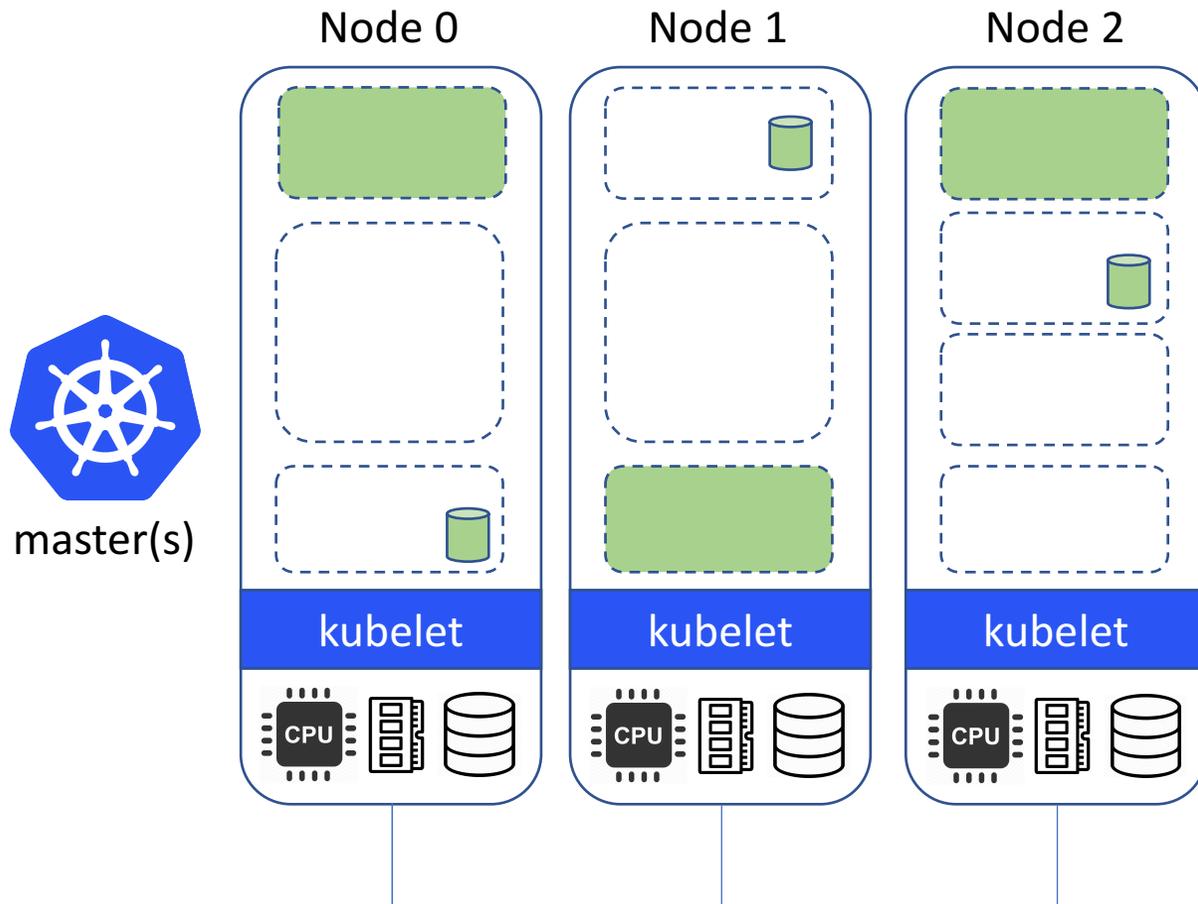

K8S Cluster with Local Storage

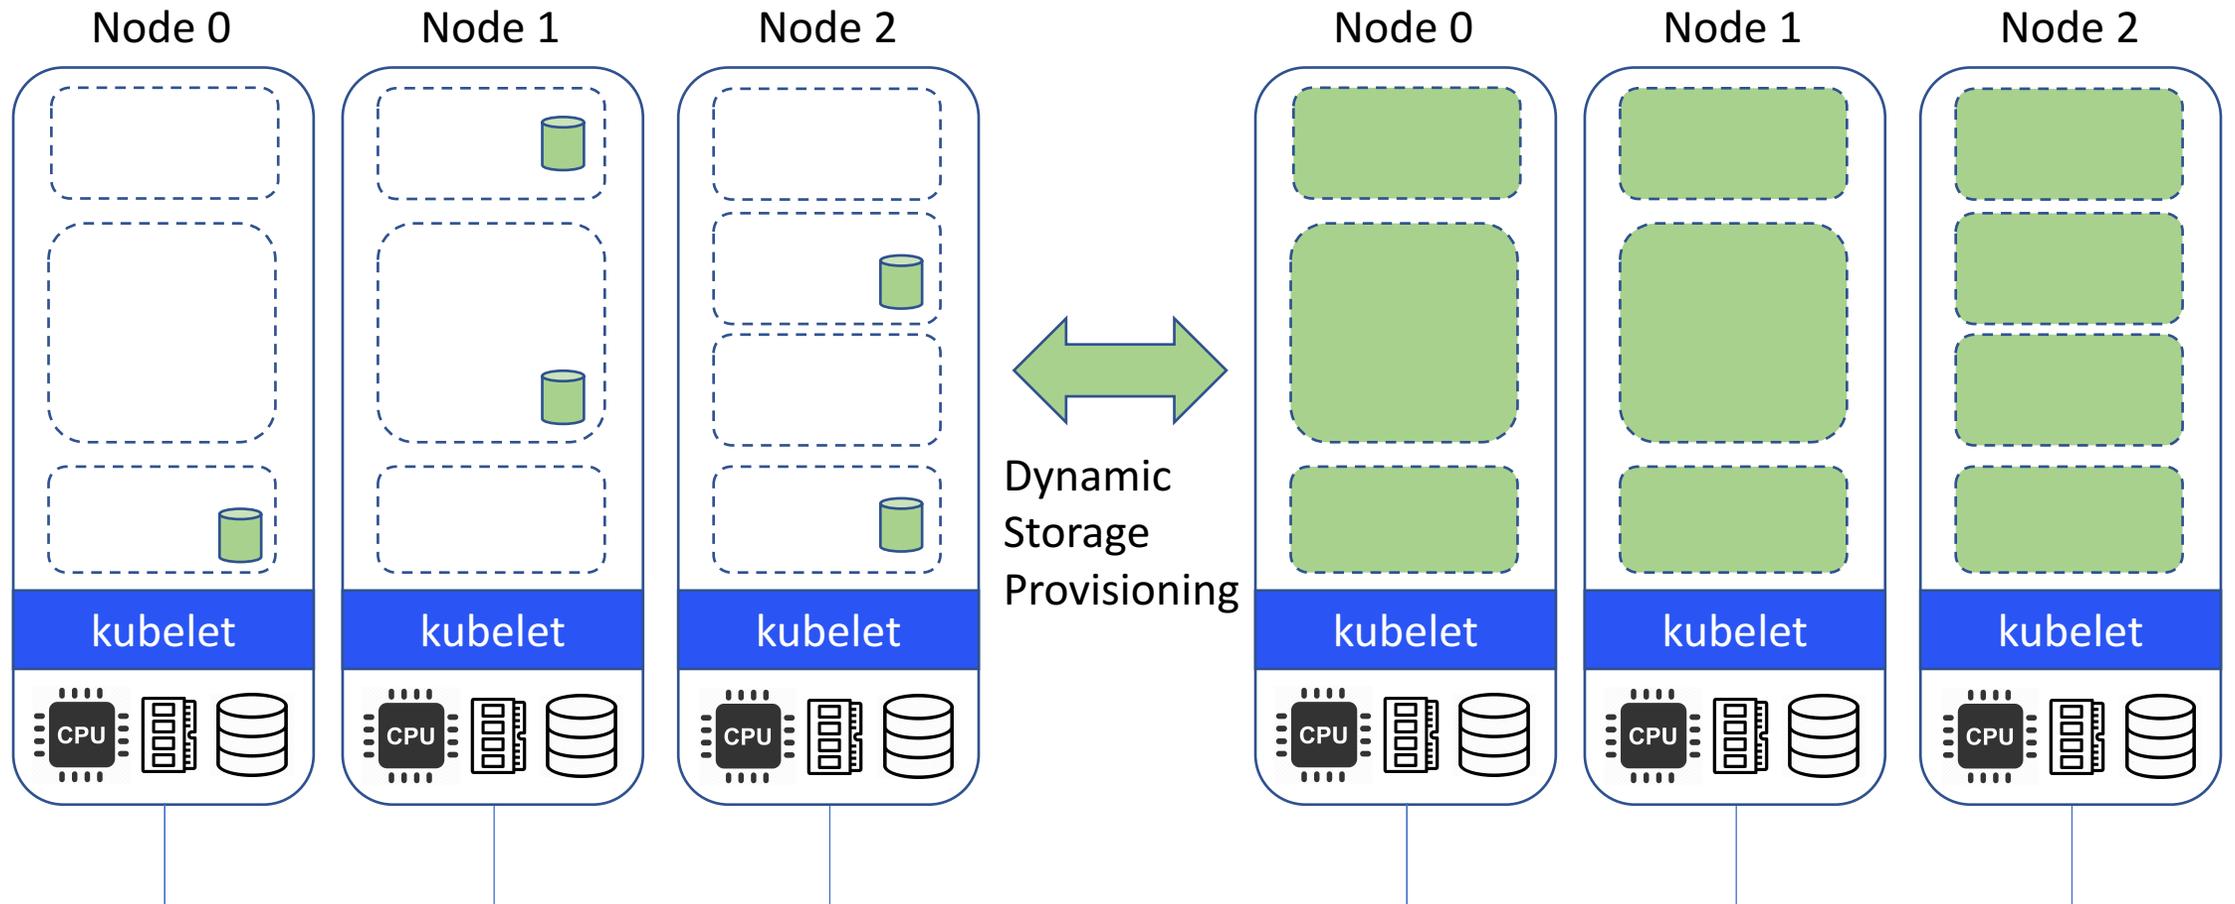

K8S Cluster with External Storage

K8S with Converged Storage

K8S Cluster with External K8S Storage

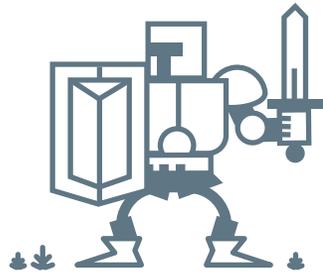

ROOK

Open source file, block and object storage for your cloud-native environment.

What is Rook?

Battle-tested software defined storage

Rook is based on an embedded version of Ceph, which has 10+ years of production deployments and runs some of the worlds largest clusters.

Cloud-native integration

Rook runs as a cloud-native service for optimal integration with applications in need of block, object, or file storage.

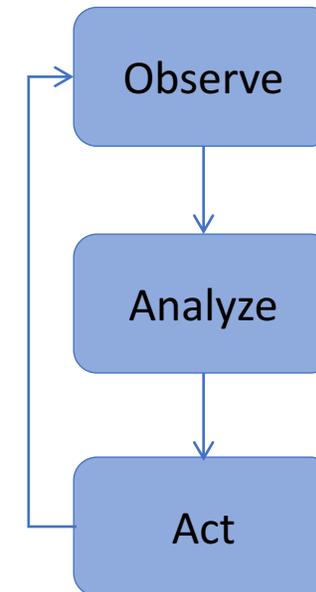

Open Source

Rook is open source software released under Apache 2.0 license. We picked this permissive license to foster our community of developers.

DEMO

Storage Operator

- Defines *desired state* for the storage cluster
 - Implemented as TPRs
 - Extensions to the K8S API
 - TPRs for Cluster, Storage Node, Pool, Object Store, etc.
- The Operator implements a state machine
 - Watches for changes in desired state
 - Watches for changes in the cluster
 - Applies changes to the cluster to make it match desired
- The Operator leverages the full power of K8S
 - Services, ReplicaSets, DaemonSets, Secrets, ...
 - Contains all the logic to manage Ceph at scale
 - Handles stateful upgrades
 - Handles rebalancing the cluster
- Not on the data path – can be offline for minutes
