

Introduction to Istio Configuration: Today & Tomorrow

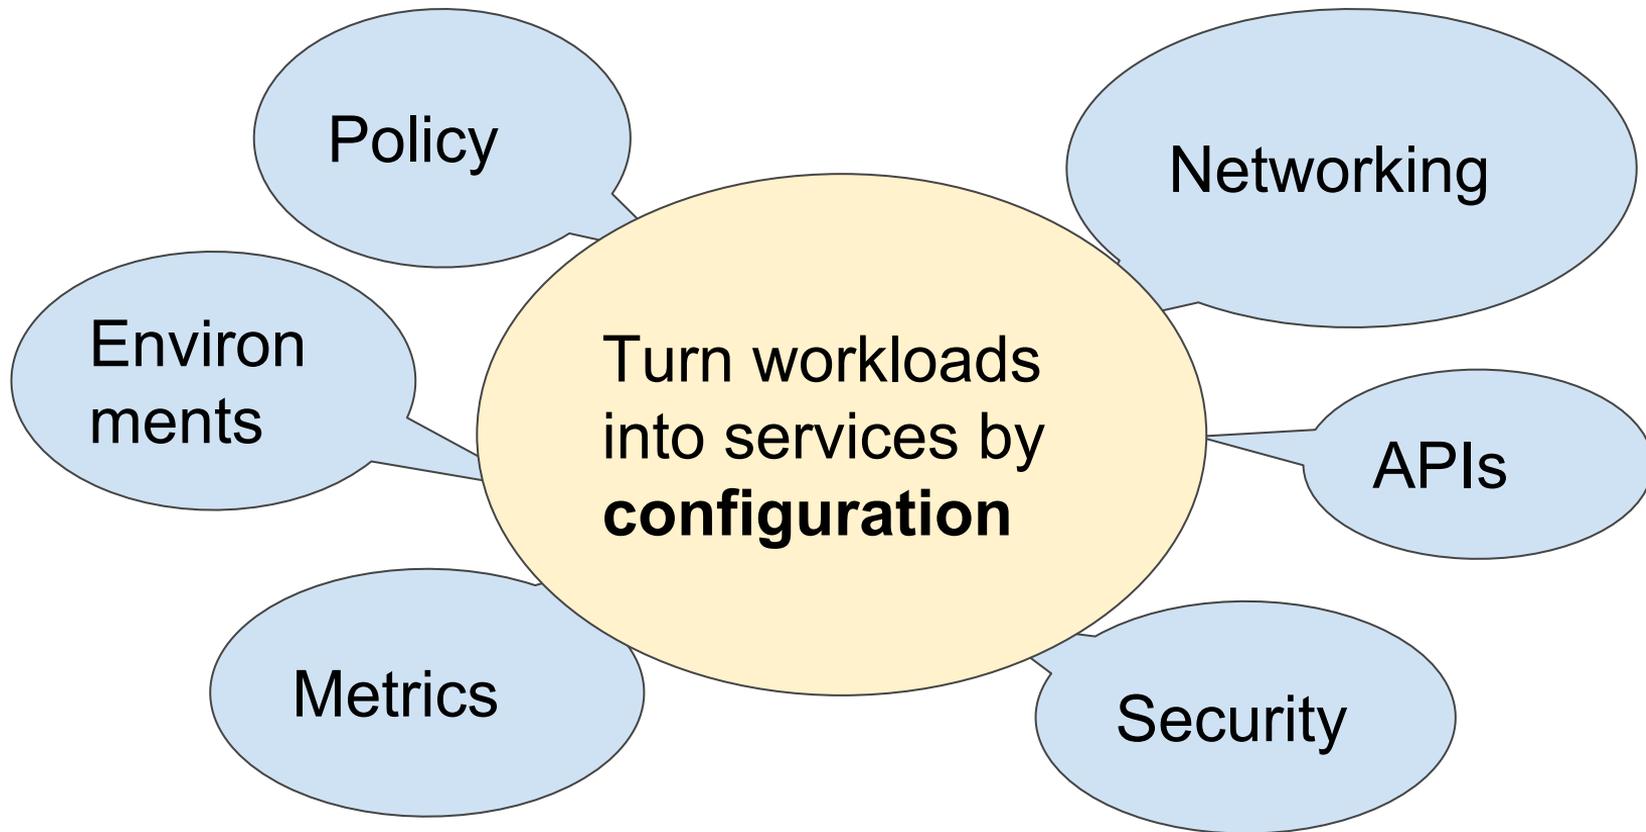

May 2, 2018 [schedule](#)

Joy Zhang [@JoyXZhang](#), Google

What is Istio? istio.io

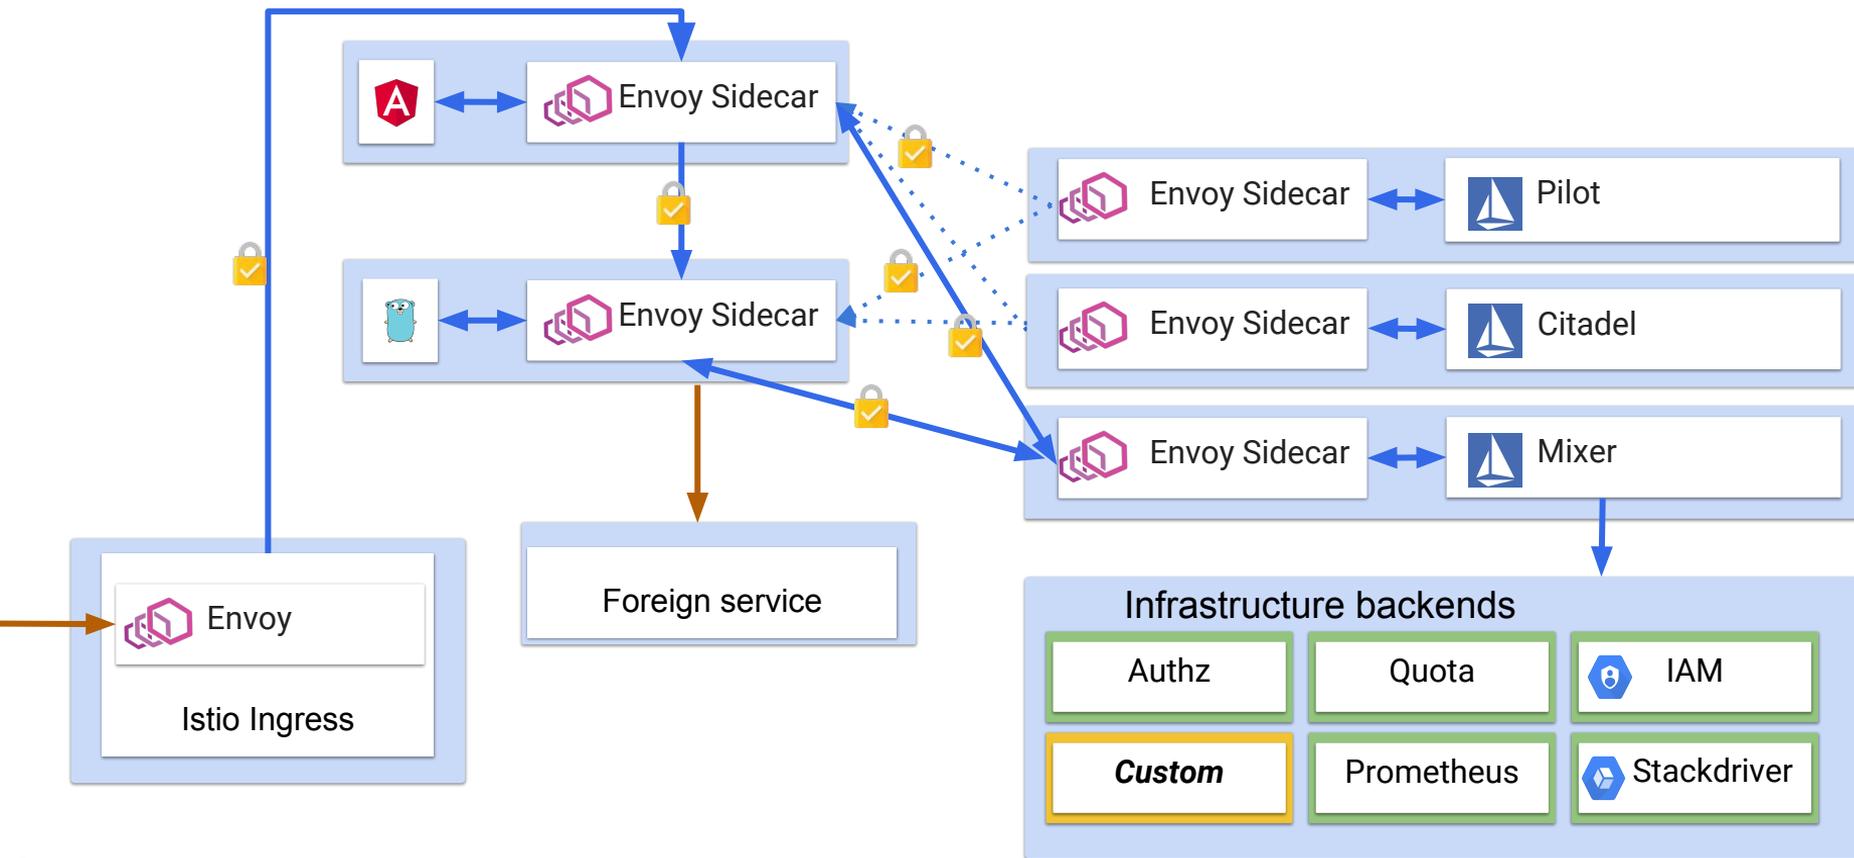

What is Istio? istio.io

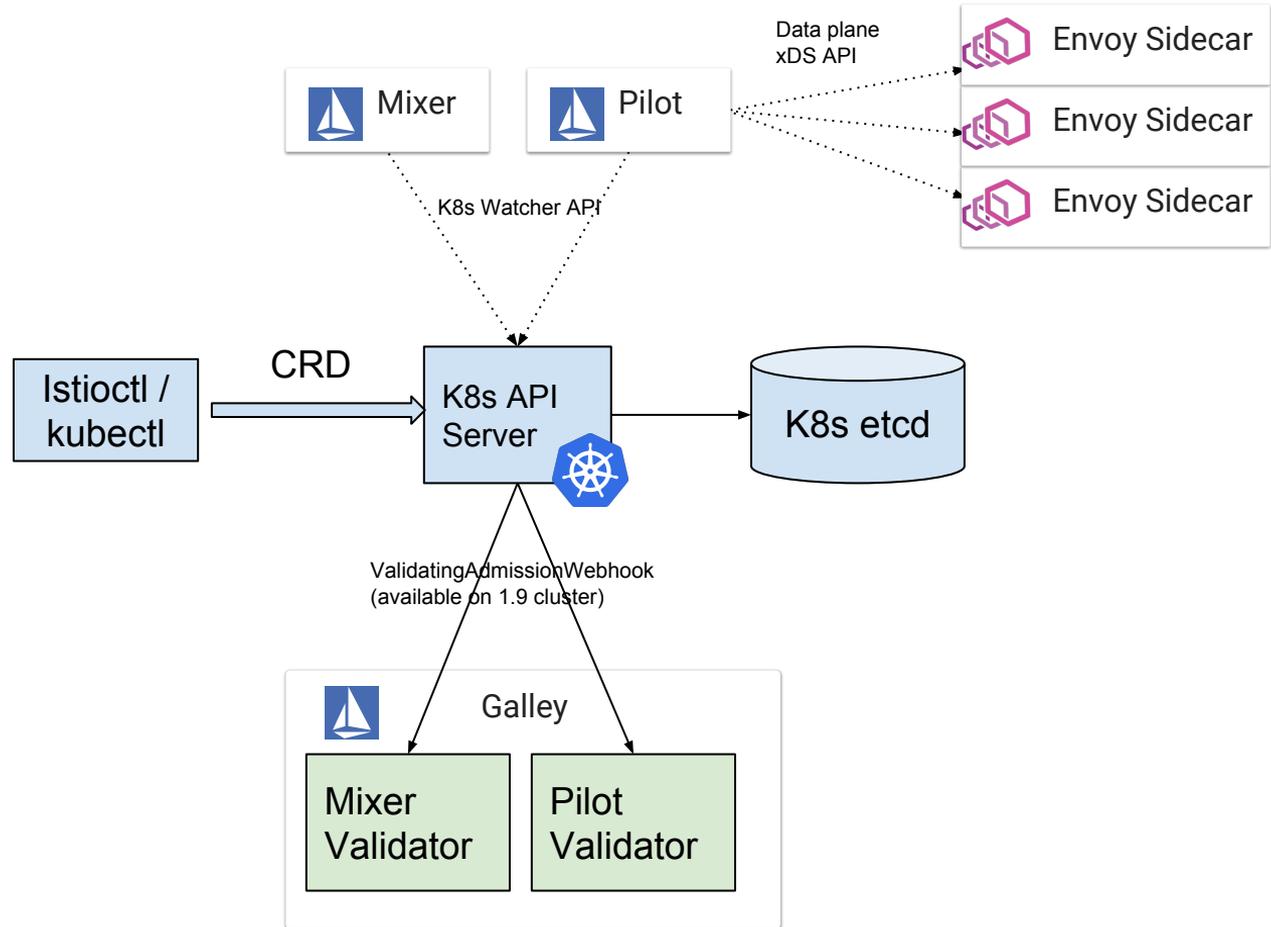

What does that mean?

- Istio allows you to
 - Switch traffic between prod and canary.
 - Switch mTLS and non-mTLS.
 - Expose an external service endpoints.
 - Specify an API vocabulary for a service.
 - Add rate limiting.
 - Add monitoring metrics.
 - ... many, many.
- through configurations, all ***without*** dev work.

Istio architecture

Scale linearly with
components/features

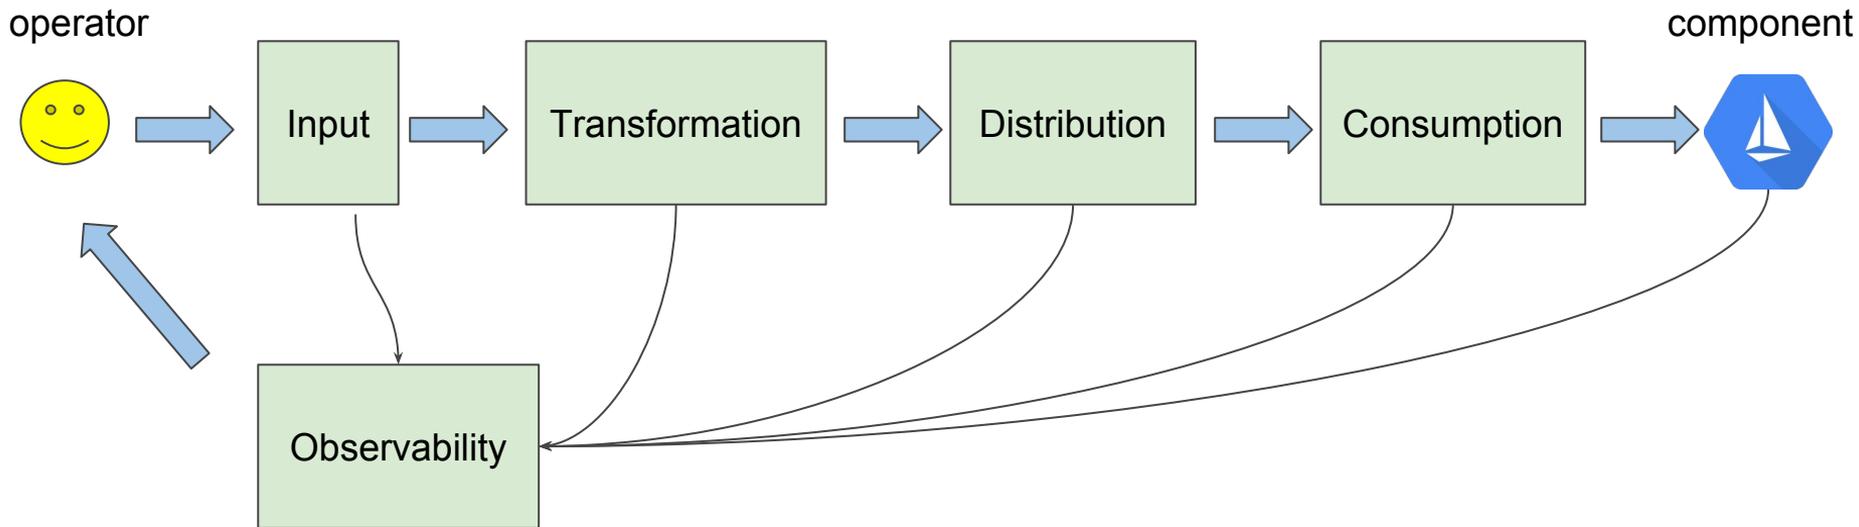

User problems with the existing model

- Config authoring [link](#)
 - Lack of abstraction, too much implementation details.
 - Usability may suffer as a result of performance optimization.
 - Poor diagnosability.
 - Minimal mesh wide reuse.
 - Unsatisfactory resource ACL model.
- Config distribution [link](#)
 - Lack of control of the rollout.
 - Lack of isolation and serialization.
 - Difficult to rollback.
 - Eventual consistency & emergent config state.
 - Lack of automation for multi-environments.

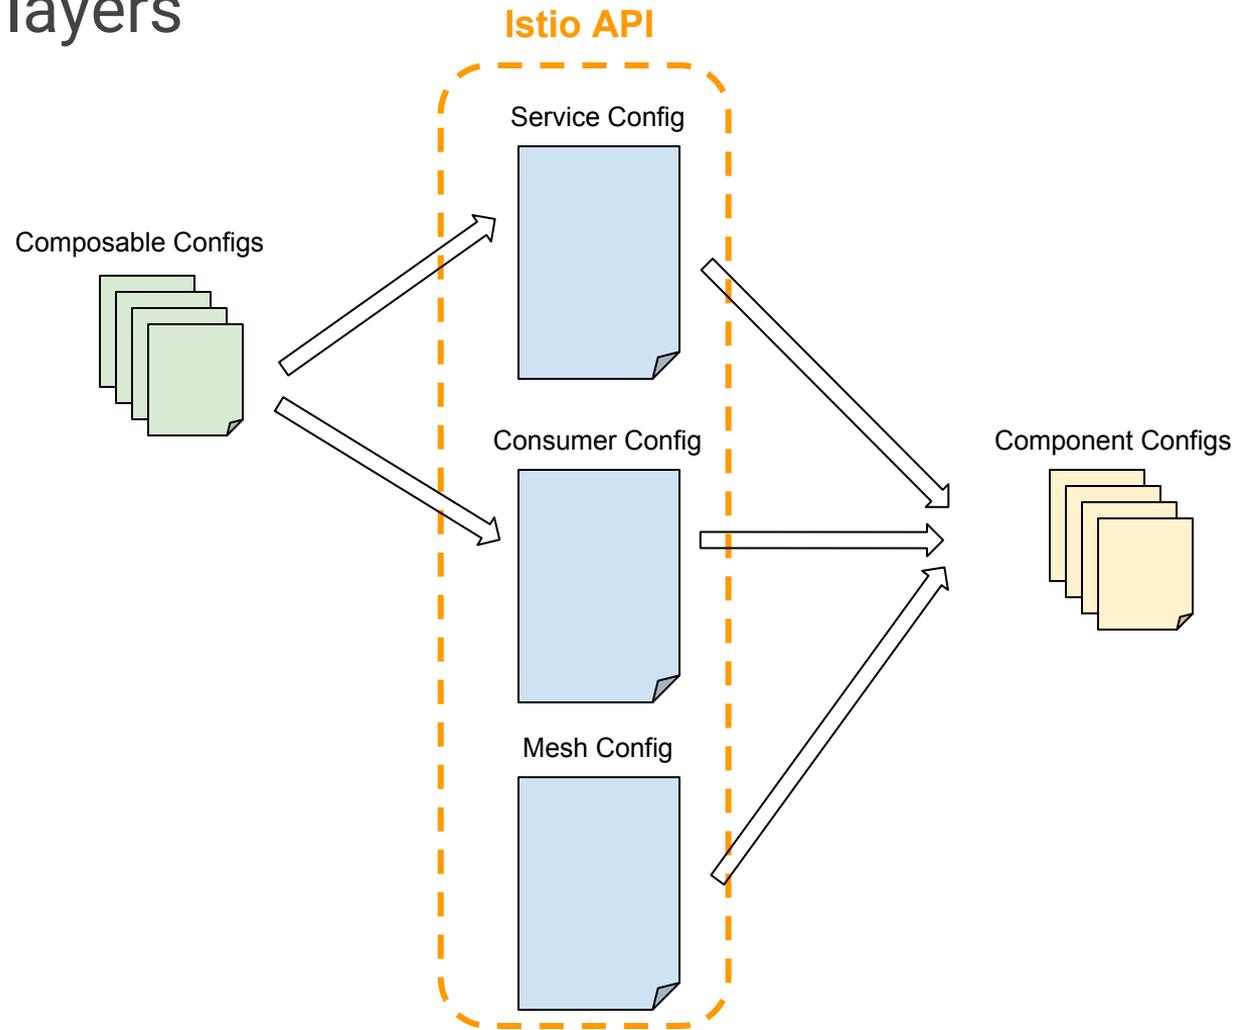

What's next?

Introduce a configuration pipeline

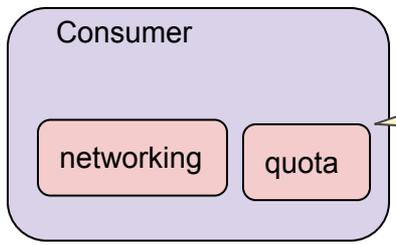

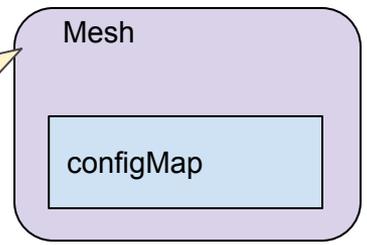

New API layers

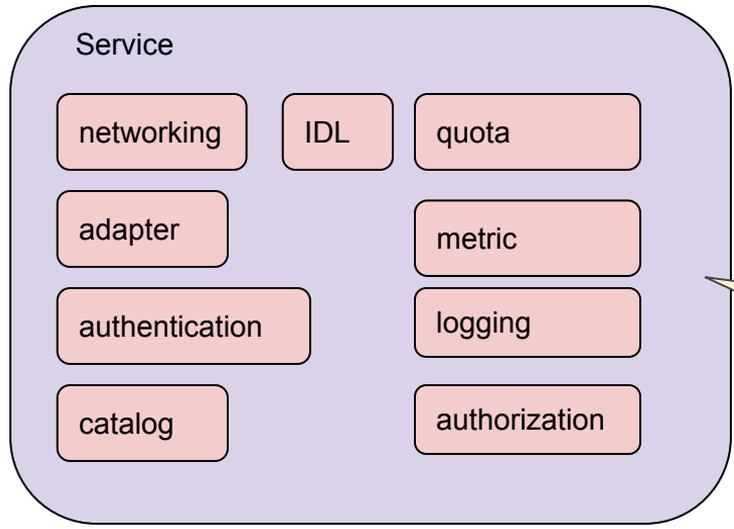

Component centric to feature centric <https://goo.gl/41fAYK>

Small amount of global runtime configs

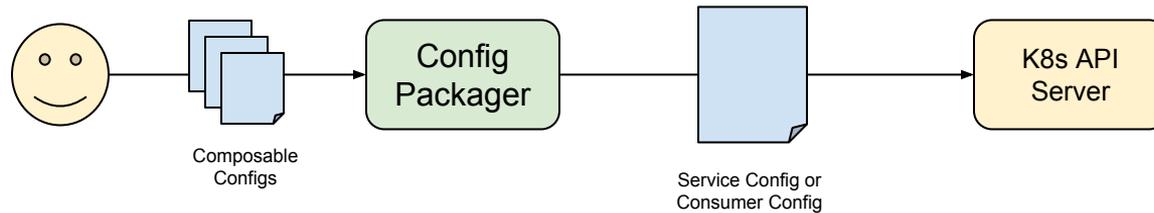

Configs for consuming Istio services, a consumer overriding model for service config.

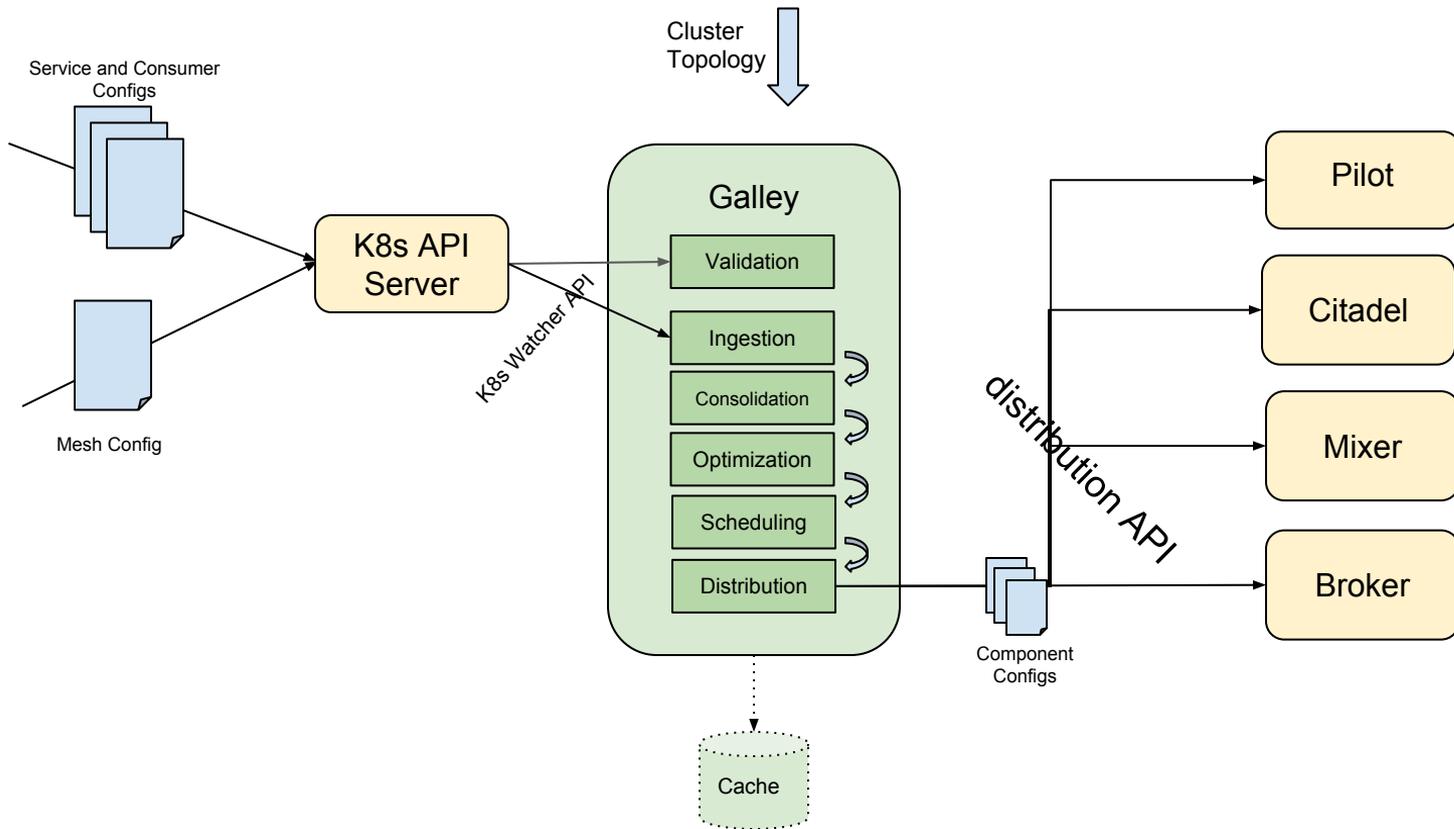

Configs for the producer service. Most of the configs Istio operators expect to write.

Composable authoring model

- Reusable and scalable.
- Composable config is non-architectural, allow customized solutions.
- External tooling tailors for small/large mesh use cases.
 - ACL resource hierarchies.
 - Integration with CI/CD.

Config processing engine -- Galley

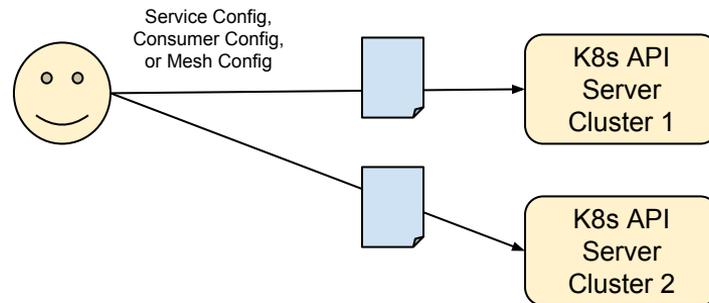

More about Galley

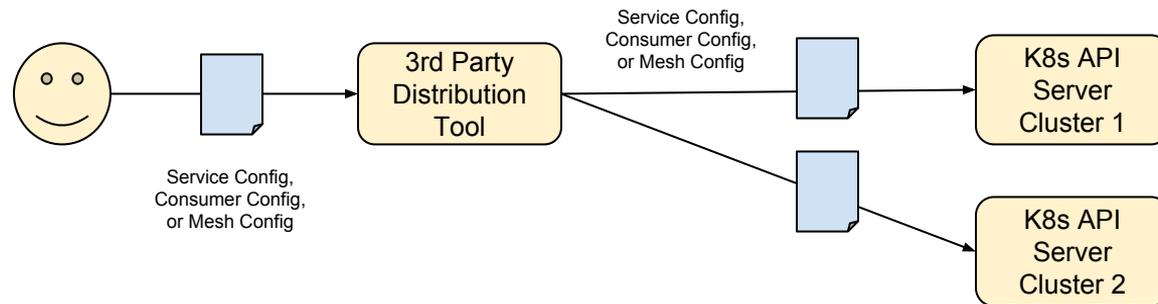

- In-cluster.
- Low latency delivery.
- Sharding/downscoping, less config for components.
- Rollout status.
- Compatible to K8s controller pattern.

Multi-cluster/environments solution

Manual

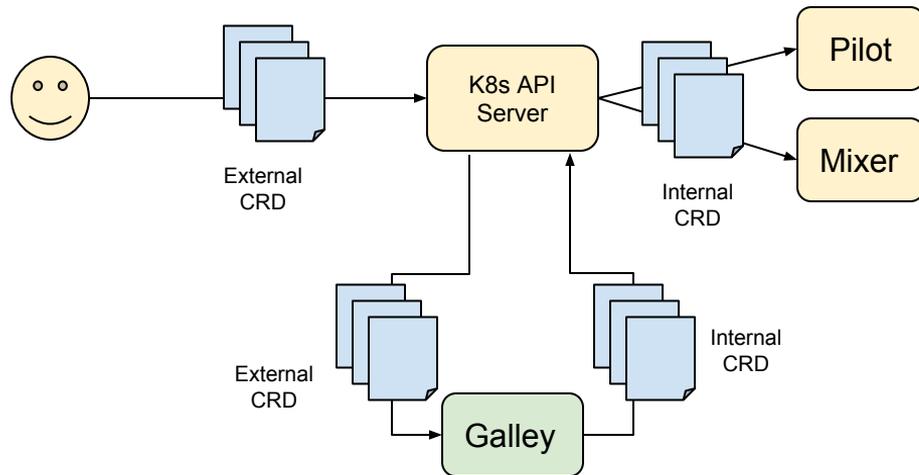

Automatic

Where are we now?

Requirements

- Format
 - Focus on a service operator oriented experience.
 - Intent-driven, declarative.
 - Reusability on large meshes.
 - Safe API upgrade.
 - Consistent ACL model.
- Distribution
 - Rollout staging.
 - Config resource lifecycle management.
 - Simple and efficient runtime configuration.
 - Monitoring.
