**05** Policy in production

# Policy and software development

What do we mean by policy?

---

# policy

*noun* [ C ]

UK /'pɒl.ə.si/ US /'pɑː.lə.si/

a set of ideas or a plan of what to do in particular situations that has been agreed to officially by a group of people, a business organization, a government, or a political party.

---

# policy

*noun* [ C ]

UK /'pɒl.ə.si/ US /'pɑː.lə.si/

a set of ideas or a plan of what to do in particular situations that has been agreed to officially by a group of people, a business organization, a government, or a political party.

Cambridge Dictionary

---

**All Go projects should have been updated to use Go 1.13**

---

# policy

*noun* [ C ]

UK /'pɒl.ə.si/ US /'pɑː.lə.si/

a set of ideas or a plan of what to do in particular situations that has been agreed to officially by a group of people, a business organization, a government, or a political party.

Cambridge Dictionary

---

All Go projects should have been updated to use Go 1.13

**Our open source projects should all use the Apache 2.0 license**

---

# policy

*noun* [ C ]

UK /'pɒl.ə.si/ US /'pɑː.lə.si/

a set of ideas or a plan of what to do in particular situations that has been agreed to officially by a group of people, a business organization, a government, or a political party.

Cambridge Dictionary

---

All Go projects should have been updated to use Go 1.13

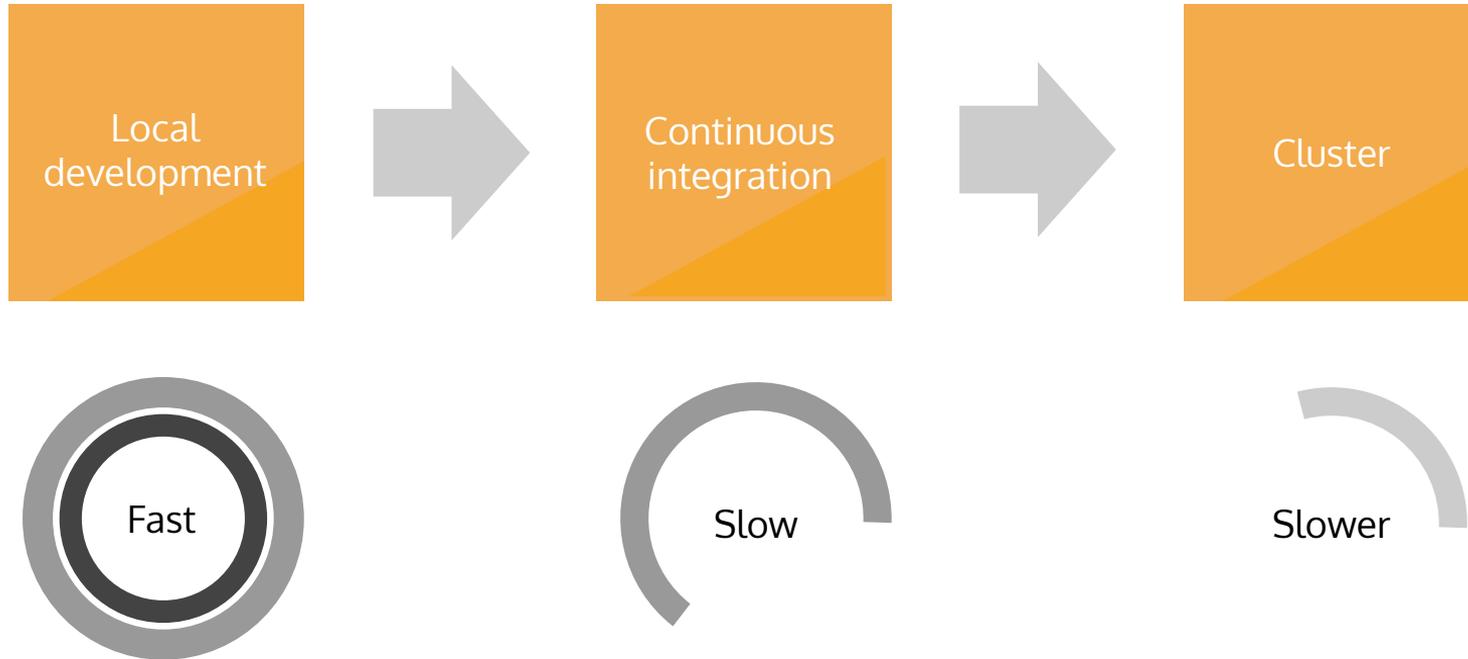

Our open source projects should all use the Apache 2.0 license

**Dockerfiles should all have a maintainers label and not use FROM with images tagged latest**

# Where in our application lifecycle do we enforce policy?

# The importance of developer feedback

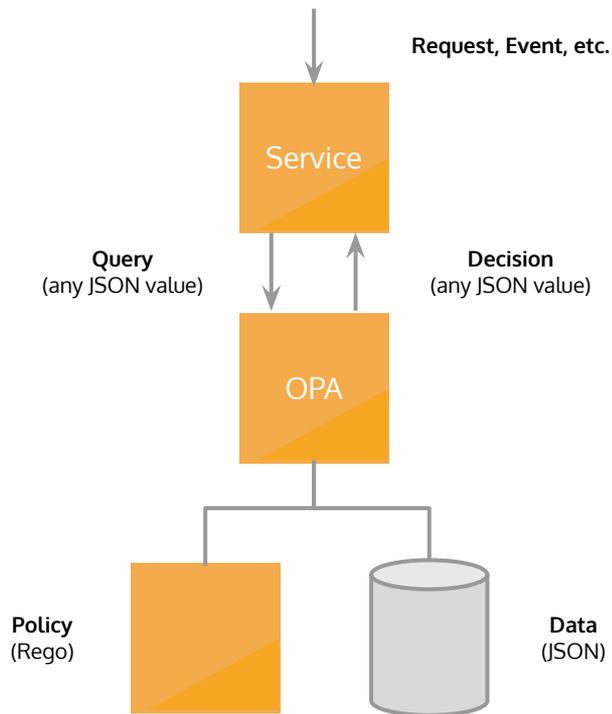

# Open Policy Agent and Conftest

A quick introduction

# What is Open Policy Agent?

[github.com/open-policy-agent/opa](https://github.com/open-policy-agent/opa)

- An open source policy engine
- A CNCF incubating project
- Usable as a library and a service
- A vibrant open source community community
- Provides a declarative DSL for authoring policy (Rego)

---

# A quick example

## Let's suggest some places to eat this evening

```
// Where should we eat while at KubeCon in San Diego?  
{  
  "restaurants": [  
    "Campfire",  
    "Galaxy Taco",  
    "Olive Garden",  
    "Dija Mara",  
    "Mikkeller",  
    "Wrench and Rodent"  
  ]  
}
```

## A quick example

# Let's describe a policy for our culinary preferences

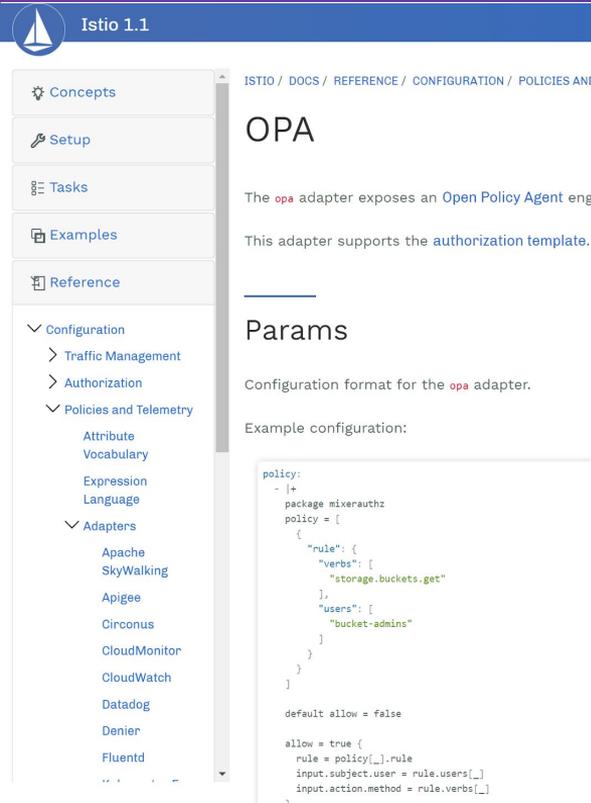

```
deny["We can't go somewhere with unlimited breadstick"] {  
  input.restaurants[_] = "Olive Garden"  
}
```

We should **deny** any input for which

The **"restaurants"** list

Contains a value of **"Olive Garden"**

## OPA

The opa adapter exposes an Open Policy Agent engine.

This adapter supports the authorization template.

## Params

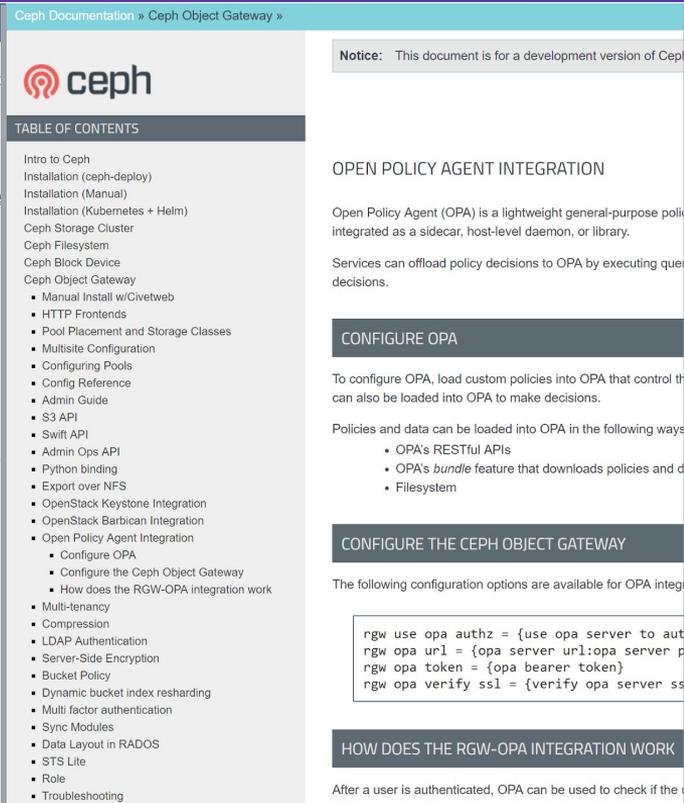

Configuration format for the opa adapter.

Example configuration:

```
policy:
- |+
  package mixerauthz
  policy = {
  {
    "rule": {
      "verbs": [
        "storage.buckets.get"
      ],
      "users": [
        "bucket-admins"
      ]
    }
  }
}

default allow = false

allow = true {
  rule = policy[_].rule
  input.subject.user = rule.users[_]
  input.action.method = rule.verbs[_]
```

## OPEN POLICY AGENT INTEGRATION

Open Policy Agent (OPA) is a lightweight general-purpose policy engine that can be integrated as a sidecar, host-level daemon, or library.

Services can offload policy decisions to OPA by executing query requests.

### CONFIGURE OPA

To configure OPA, load custom policies into OPA that control the service. Policies can also be loaded into OPA to make decisions.

Policies and data can be loaded into OPA in the following ways:

- OPA's RESTful APIs
- OPA's bundle feature that downloads policies and data
- Filesystem

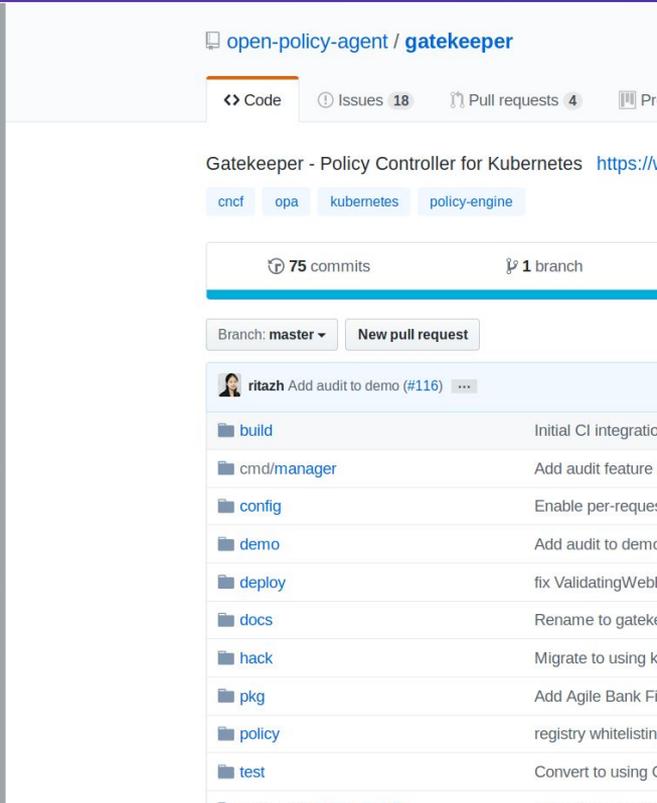

### CONFIGURE THE CEPH OBJECT GATEWAY

The following configuration options are available for OPA integration:

```
rgw use opa authz = {use opa server to authz}
rgw opa url = {opa server url:opa server port}
rgw opa token = {opa bearer token}
rgw opa verify ssl = {verify opa server ssl}
```

### HOW DOES THE RGW-OPA INTEGRATION WORK

After a user is authenticated, OPA can be used to check if the user is allowed to perform the requested action.

README.md	fix current version for linux in README (#155)	16 hours ago
acceptance.bats	Handle explicitly blank filenames passed into conftest	10 days ago

# What is Conftest?

[github.com/instrumenta/conftest](https://github.com/instrumenta/conftest)

```
$ conftest
Test your configuration files using Open Policy Agent

Usage:
  conftest [command]

Available Commands:
  help          Help about any command
  parse        Print out structured data from your input
  pull         Download individual policies
  push         Upload OPA bundles to an OCI registry
  test         Test your configuration files using Open P
  update       Download policy from registry
  verify       Verify Rego unit tests
```

- Developer-focused UX for config policy
- An open source project built on top of OPA
- Easy to use with different inputs (JSON, YAML, INI, HCL, TOML, CUE, Dockerfile)
- Build to be used as a testing tool (JSON, TAP and plain text output)
- Built-in tools for sharing policy (via Git, OCI registries, S3 and more)

# Conftest

## A simple CLI tool for asserting policy

```
$ conftest test restaurants.json -p restaurants.rego  
FAIL - restaurants.json - We can't go somewhere with unlimited breadstick
```

# Conftest

## Integrated into developer tools

GitHub Action

### Conftest

v0.4.0 Latest version

## Conftest

A [GitHub Action](#) for using [Conftest](#) in your workflows.

You can use the action as follows:

```
on: push
name: Validate
jobs:
  conftest:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@master
      - name: test
        uses: instrumenta/conftest-action@master
        with:
          files: deployment.yaml
```

The Conftest Action has a small number of properties which map to the parameters for Conftest itself. These are passed to the action using `with`, as demonstrated with `files` in the above example.

Property	Default	Description
files	-	Required which files to test
policy	policy	Where to find the policy folder or files

tektoncd / catalog

- conftest.yaml Be explicit about files being a string 4 days ago
- helm-conftest.yaml A new task related to Conftest which makes testing Helm charts easier 19 days ago

README.md

## Conftest

These tasks make it possible to use [Conftest](#) within your Tekton pipelines. Conftest is a tool for testing configuration files using [Open Policy Agent](#).

### Installation

In order to use Conftest with Tekton you need to first install the task.

```
kubectl apply -f https://raw.githubusercontent.com/tektoncd/catalog/master/conftest/conftest.yaml
```

Conftest also has a Helm plugin, which renders the Helm chart before applying the policy. For that task use:

```
kubectl apply -f https://raw.githubusercontent.com/tektoncd/catalog/master/conftest/helm-conftest.yaml
```

### Usage

[Explore Orbs](#) / kendev/conftest-orb

### kendev/conftest-orb@0.0.9

Report This Orb

Easily integrate Conftest View this orb's source: <https://github.com/kendev/conftest-orb>

Orb Created: October 19, 2019 | Version Published: October 21, 2019 | Releases: [0.0.9](#)

[See Orb Licensing](#)

## Orb Quick Start Guide

1. Use CircleCI version 2.1 at the top of your `.circleci/config.yml` file.

version: 2.1

Copy This Code

If you do not already have Pipelines enabled, you'll need to go to Project Settings -> Advanced Settings and turn it on.

2. Add the `orbs` stanza below your version, invoking the orb:

```
orbs:
  conftest-orb: kendev/conftest-orb@0.0.9
```

Copy This Code

3. Use `conftest-orb` elements in your existing workflows and jobs.
4. Opt-in to use of third-party orbs on your organization's Security settings page. [Read more in the docs here.](#)

## Usage Examples

### simple

Runs conftest tests against the target file.

# Demo

# Applying policy to a real project

## Enforcing development standards

# Python application example

## Check Python development environment settings

```
package pipfile

deny[msg] {
    version := to_number(input.requires.python_version)
    version < 3
    msg := sprintf("Should be using Python 3, currently Using Python %v", [version])
}

deny[msg] {
    not input.source[i].verify_ssl = true
    name := input.source[i].name
    msg := sprintf("You must verify SSL for %v", [name])
}
```

# Python application example

## Check Python development environment settings

```
$ conftest test --input toml --namespace pipfile Pipfile  
FAIL - Pipfile - You must verify SSL for pypi  
FAIL - Pipfile - Should be using Python 3, currently Using Python 2.
```

# Python application example

## Check we are using specific testing tools

```
$ conftest test --namespace pytest pytest.ini  
WARN - pytest.ini - Consider enforcing type checking when running tests  
WARN - pytest.ini - Consider enabling coverage reporting for test
```

# Python application example

## Check the Dockerfile for policy issues

```
$ confest test --namespace docker Dockerfile  
FAIL - Dockerfile - Using latest tag on base image python
```

# Python application example

## Run unit tests for our policies

```
$ conftest verify
PASS - policy/policy/pytest_test.rego - data.pytest.test_require_black
PASS - policy/policy/pytest_test.rego - data.pytest.test_require_isort
PASS - policy/policy/pytest_test.rego - data.pytest.test_require_isort_and_black
PASS - policy/policy/pytest_test.rego - data.pytest.test_recommend_coverage
PASS - policy/policy/pytest_test.rego - data.pytest.test_recommend_type_checker
PASS - policy/policy/pytest_test.rego - data.pytest.test_valid_with_required_options
PASS - policy/policy/pytest_test.rego - data.pytest.test_no_warnings_with_recommended_option
```

# Python application example

## Check policy in our Python unit tests

```
def test_policy(conftest):
    run = conftest.verify()
    assert run.success

def test_pytest_config(conftest):
    run = conftest.test("pytest.ini", namespace="pytest")
    assert run.success

def test_kubernetes_manifest_for_warnings(conftest):
    run = conftest.test("snyky.yaml")
    result = run.results[0]
    assert not result.Warnings
```

## Block deployments with policy violations

```
$ kubectl apply -f deployment.yaml
Error from server ([denied by enforce-deployment-and-pod-security-controls] nginx in the
Deployment nginx-deployment does not have a memory limit set
[denied by enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment
does not have a CPU limit set
[denied by enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment
doesn't drop all capabilities
[denied by enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment
is not using a read only root filesystem
[denied by enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment
is running as root): error when creating "deployment.yaml": admission webhook
"validation.gatekeeper.sh" denied the request: [denied by
enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment does not
have a memory limit set
[denied by enforce-deployment-and-pod-security-controls] nginx in the Deployment nginx-deployment
does not have a CPU limit set
```

# Gatekeeper

## Audit running workloads against defined policy

```
$ kubectl get SecurityControls audit-deployment-and-pod-security-controls -o yaml
...
- enforcementAction: dryrun
  kind: Deployment
  message: nginx in the Deployment nginx-deployment doesn't drop all capabilities
  name: nginx-deployment
  namespace: audit
- enforcementAction: dryrun
  kind: Deployment
  message: nginx in the Deployment nginx-deployment is not using a read only root
    filesystem
  name: nginx-deployment
  namespace: audit
- enforcementAction: dryrun
  kind: Deployment
  message: nginx in the Deployment nginx-deployment allows privilege escalation
```

# Demo

# Conclusions and the future

If all you remember is...

# Policy throughout the application lifecycle

Make adopting good  
development practice  
easier

Continuously enforce  
policy, and provide fast  
feedback to  
developers

Gate your clusters  
against violations, and  
continuously audit  
workloads

# 1. Open Source is pretty great

OPA makes building on top easy. Conftest went from me hacking on something to 6 core maintainers in 6 months.

Thanks tsandall, xchapter7x, brendanjryan, Proplex, jpreese, boranx and Blokje5

## 2. A Policy Toolkit

OPA and Conftest are not tool or platform specific. That leaves lots of room for more domain specific tools built on-top.

### 3. Lets get sharing

A lot of policy is at the organisation or community level, not per project. Lots of potential for reuse and sharing.

**This is the next frontier for policy as code.**

**Thanks**  
And any questions?
