Architecture

Migration Plan (Stage 1)

Test Vitess for Query
Compatibility

Test Application for
added Latency

Backout if any issues
discovered

Test Queries

- Best to start in development and QA
- Some applications have user-generated queries
- I still want to verify in production

Added Latency

- Vitess requires one more network hop than MySQL (VTGate Proxy)
- Simple back of napkin math: +1-2ms on each query
- Should be within tolerable threshold for most Apps
 - Edge cases are N+1 pattern, typically not well designed apps.

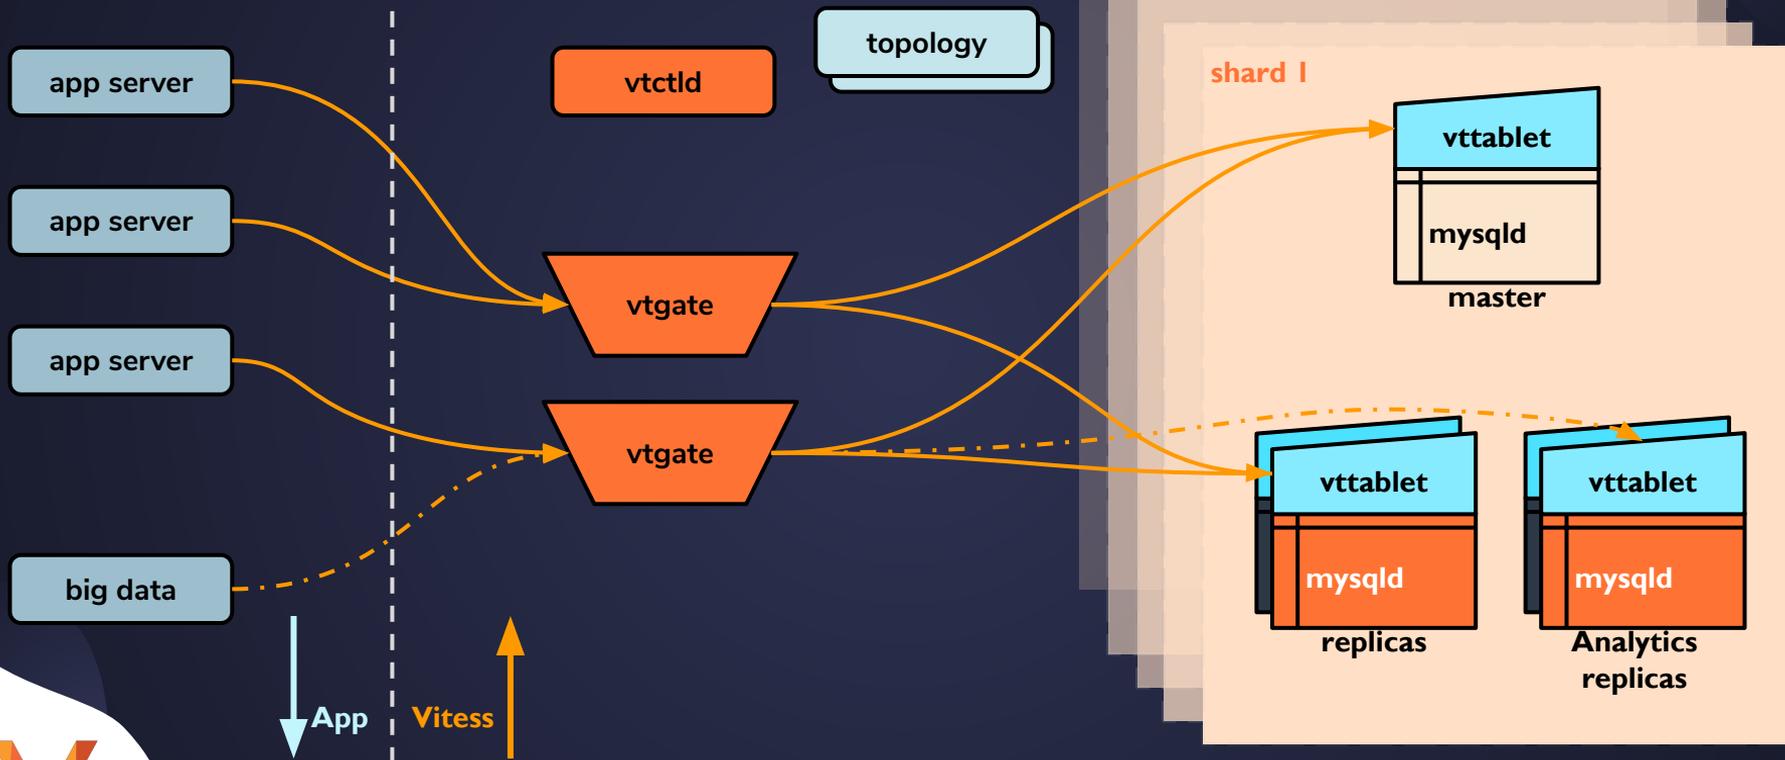

Backout Plan

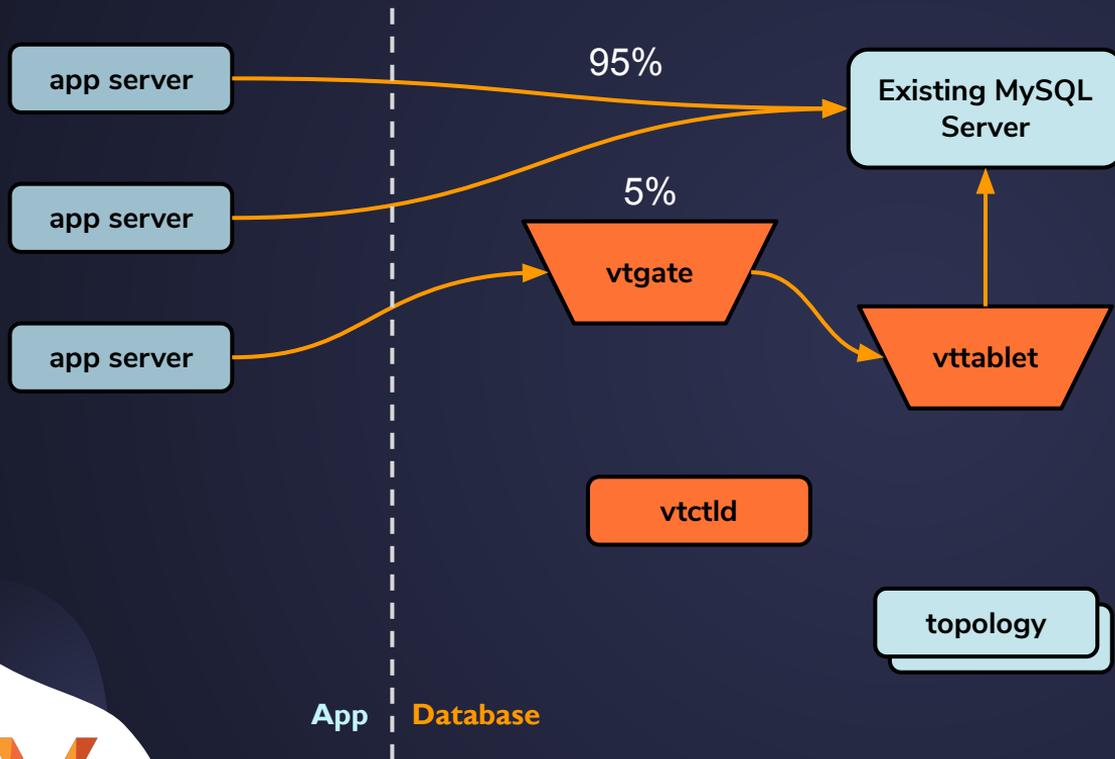

- We've verified in Dev/QA that our App works with Vitess
- No observable errors or problems
- Good ops practice is to use a Canary
 - Migrate just 5% of our traffic to Vitess
 - Rollback if any issues
 - Works great with Vitess!

Architecture

Canary Deployment

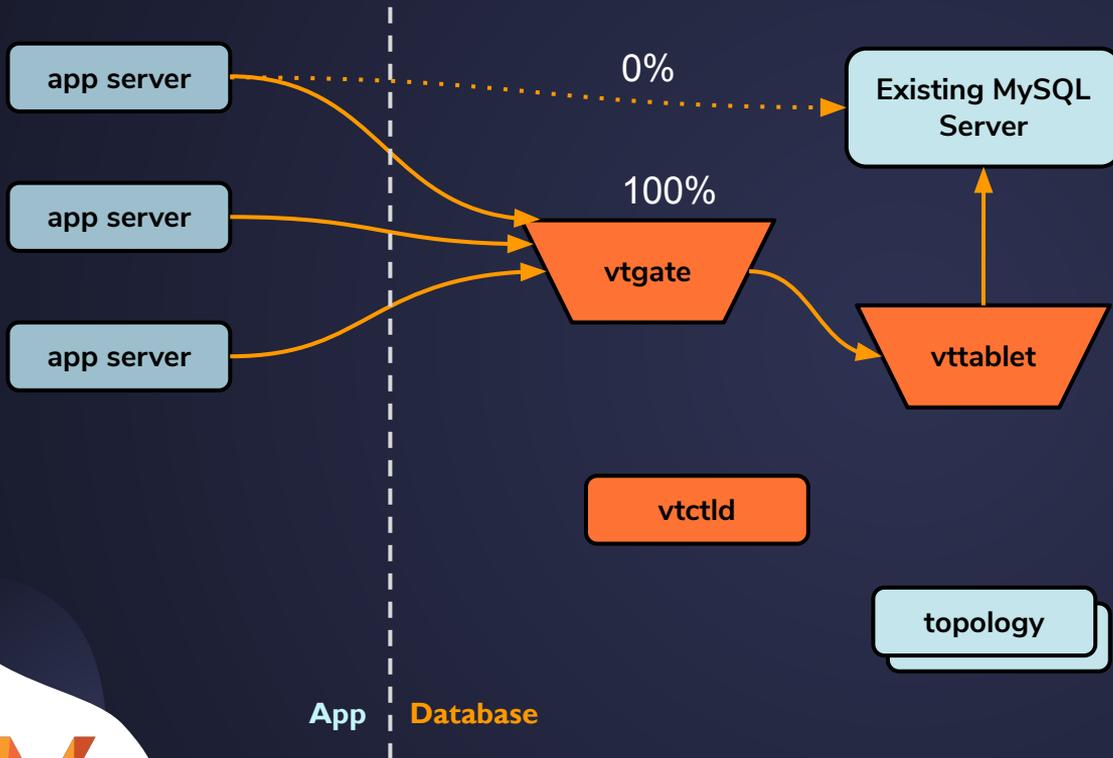

VTGate

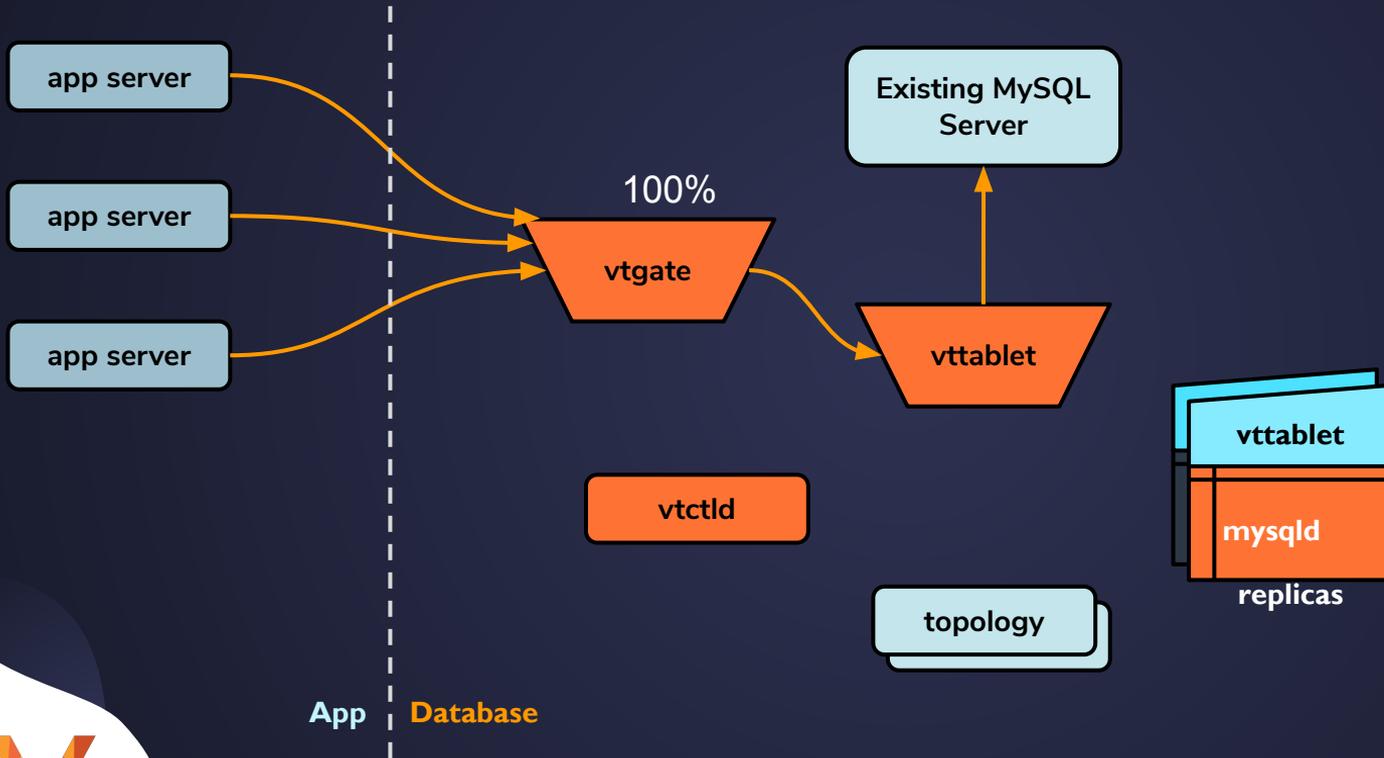

- Is a stateless process
- Does not care if you route directly to MySQL
- Does not care if you route to another VTGate

Phase 2: Prerequisite

Phase 2: Add a New Tablet

Phase 2: Table Migration

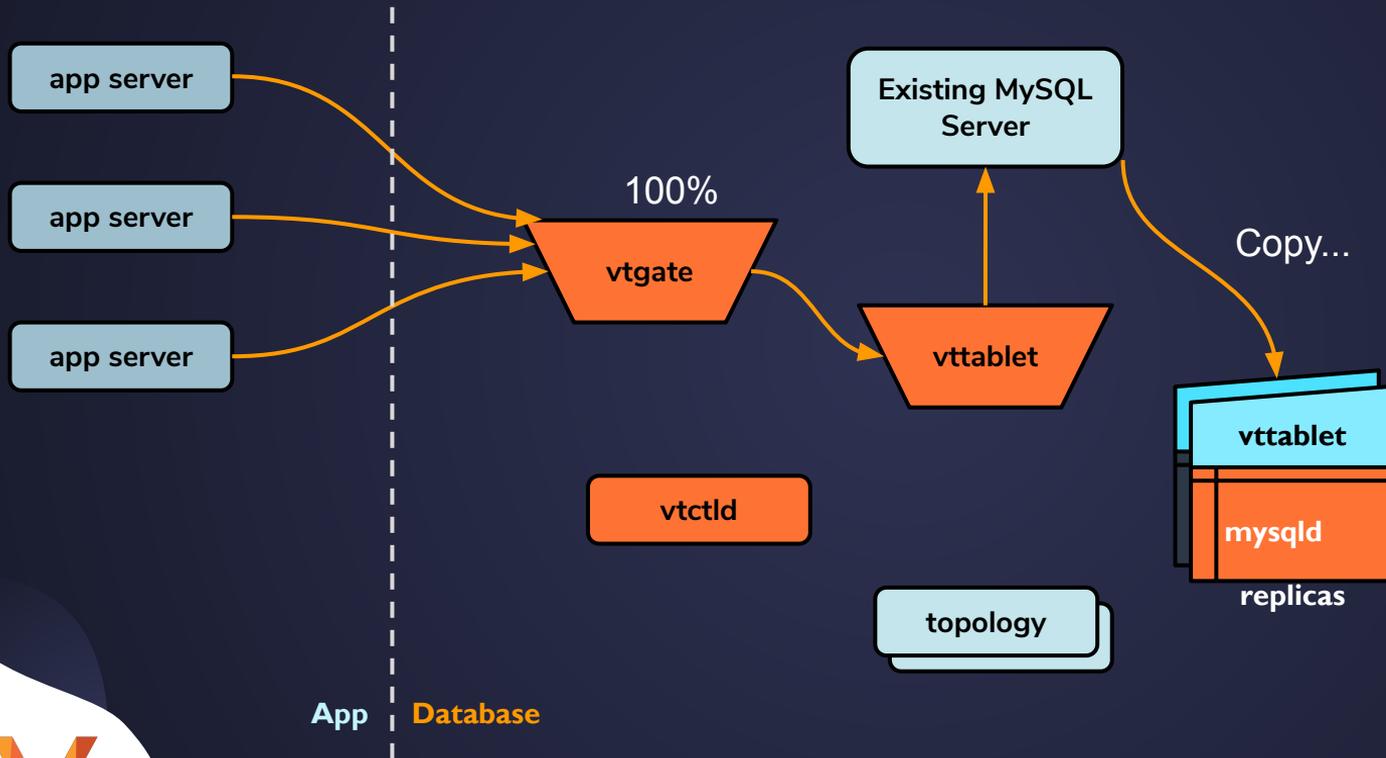

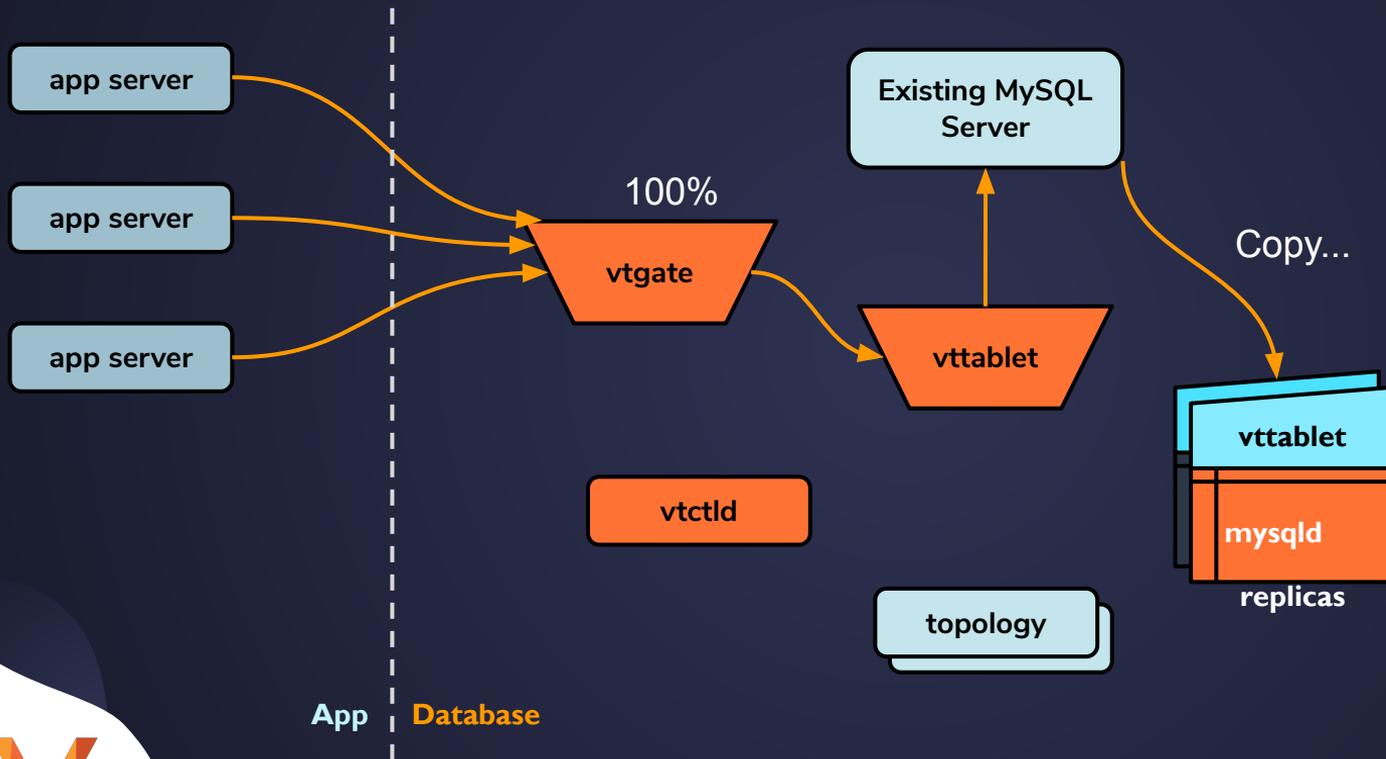

Table Migration

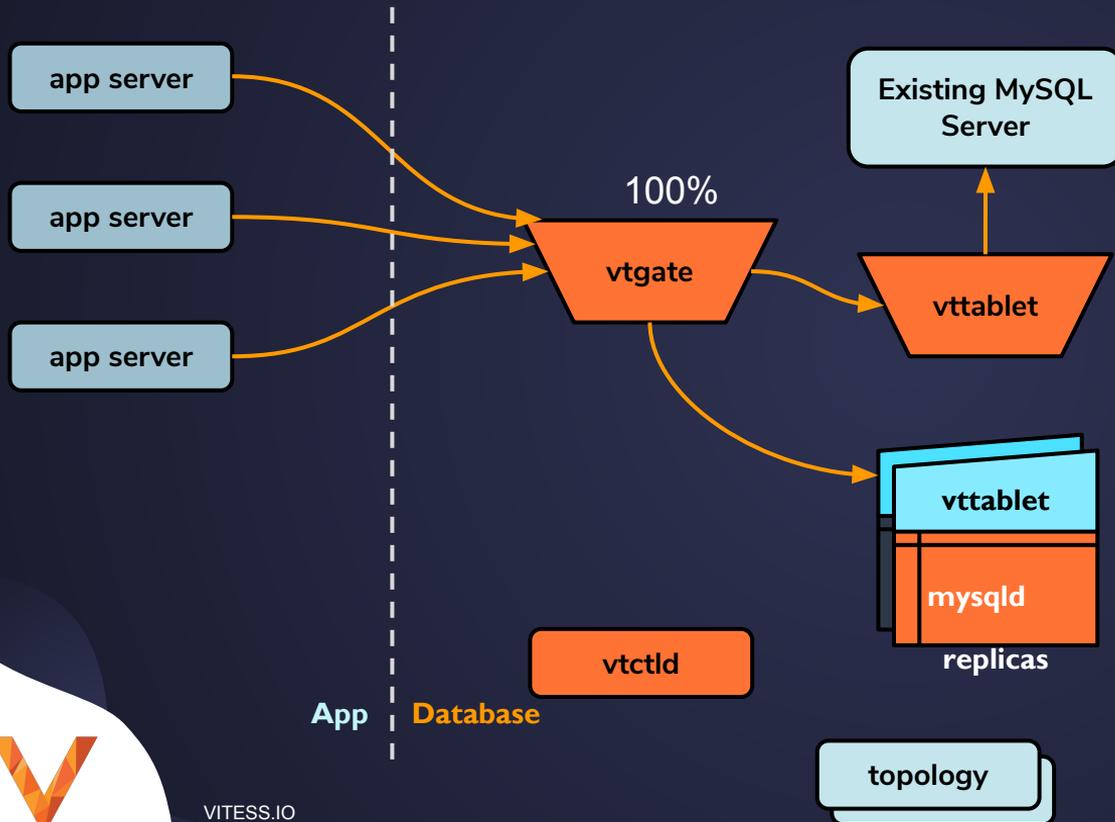

- Also called “Vertical Split Clone”
- Requires your source MySQL Server to have enabled:
 - Binary Logging with GTIDs
 - Row-based Replication
 - Matching Character Set (utf8)
- Copy phase is completely online
- Final cut-over will take a couple of seconds of blocking

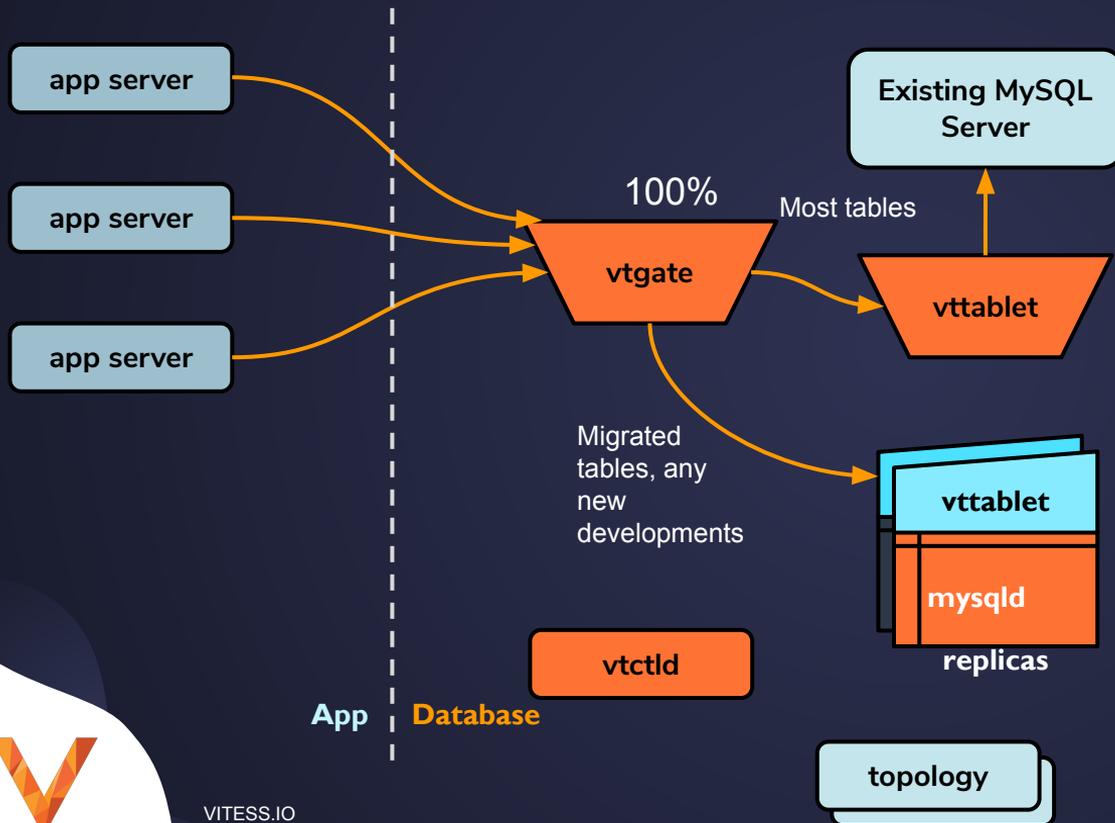

Phase 2: Completion

Phase 2: Completion

Phase 2: Completion

Our Setup

- Legacy MySQL is one Keyspace
 - In Vitess terminology “The tablet server uses an externally managed MySQL”
- New Infrastructure is a single unsharded Keyspace
 - We could have just as easily migrated to a sharded keyspace
- We can still join between tablets in each keyspace
- It is recommended to keep updates contained within a single keyspace
