# gRPC Deep Dive: Prevent Your Service From Overtaking Itself

*Lidi Zheng, Google*

# Agenda

KubeCon

CloudNativeCon

North America 2019

- What is Flow Control?
- Why is Flow Control important?
- How gRPC solves it?

# gRPC is About Distributed Systems

KubeCon

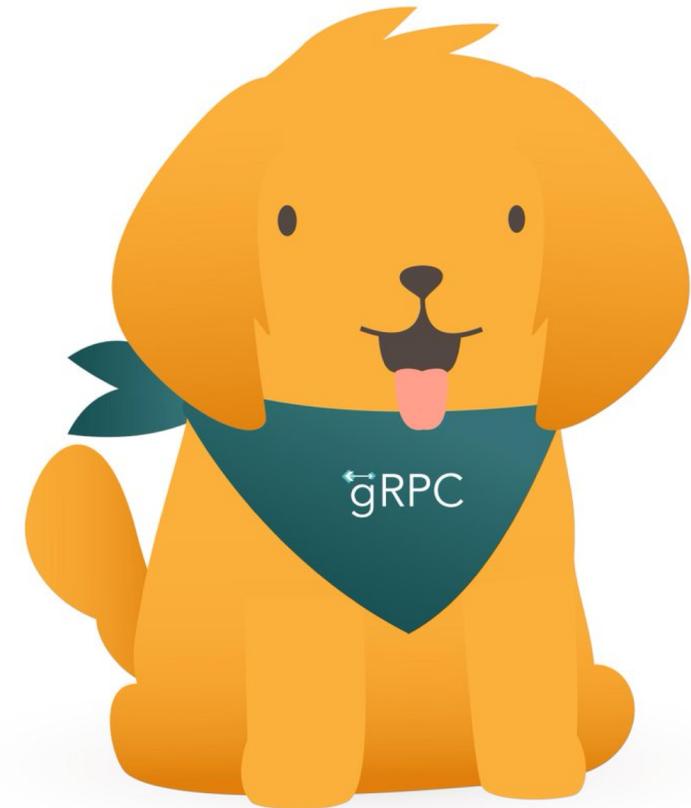

CloudNativeCon

North America 2019

## Feature Highlights

- Bi-directional streaming RPC
- **Built-in Flow Control**
- Load balancing (client-side/look-aside)
- Service config
- Interceptors
- Compression

# What is Flow Control?

KubeCon

CloudNativeCon

North America 2019

Flow control is the mechanism to **throttle the traffic** in order to protect endpoints that are under resource constraints.

# Why we need Flow Control

KubeCon

CloudNativeCon

North America 2019

Technically, it's a scaling problem.

Computational power difference

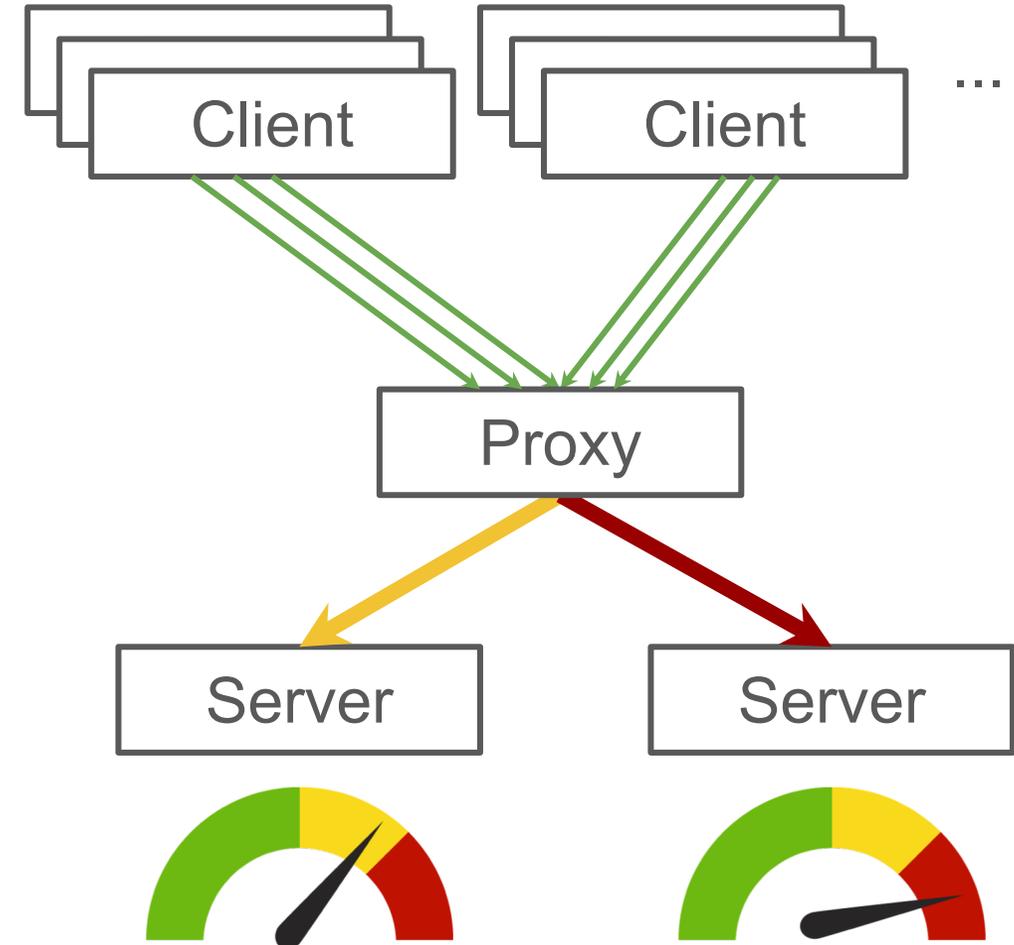

- Server : Clients (1:10<sup>2</sup>~1:10<sup>5</sup>)

Network infrastructure bottleneck

- Too many moving parts
- Difficult to debug

Maximize Concurrency

- Buffering / Caching
- Message queues

# Potential Results

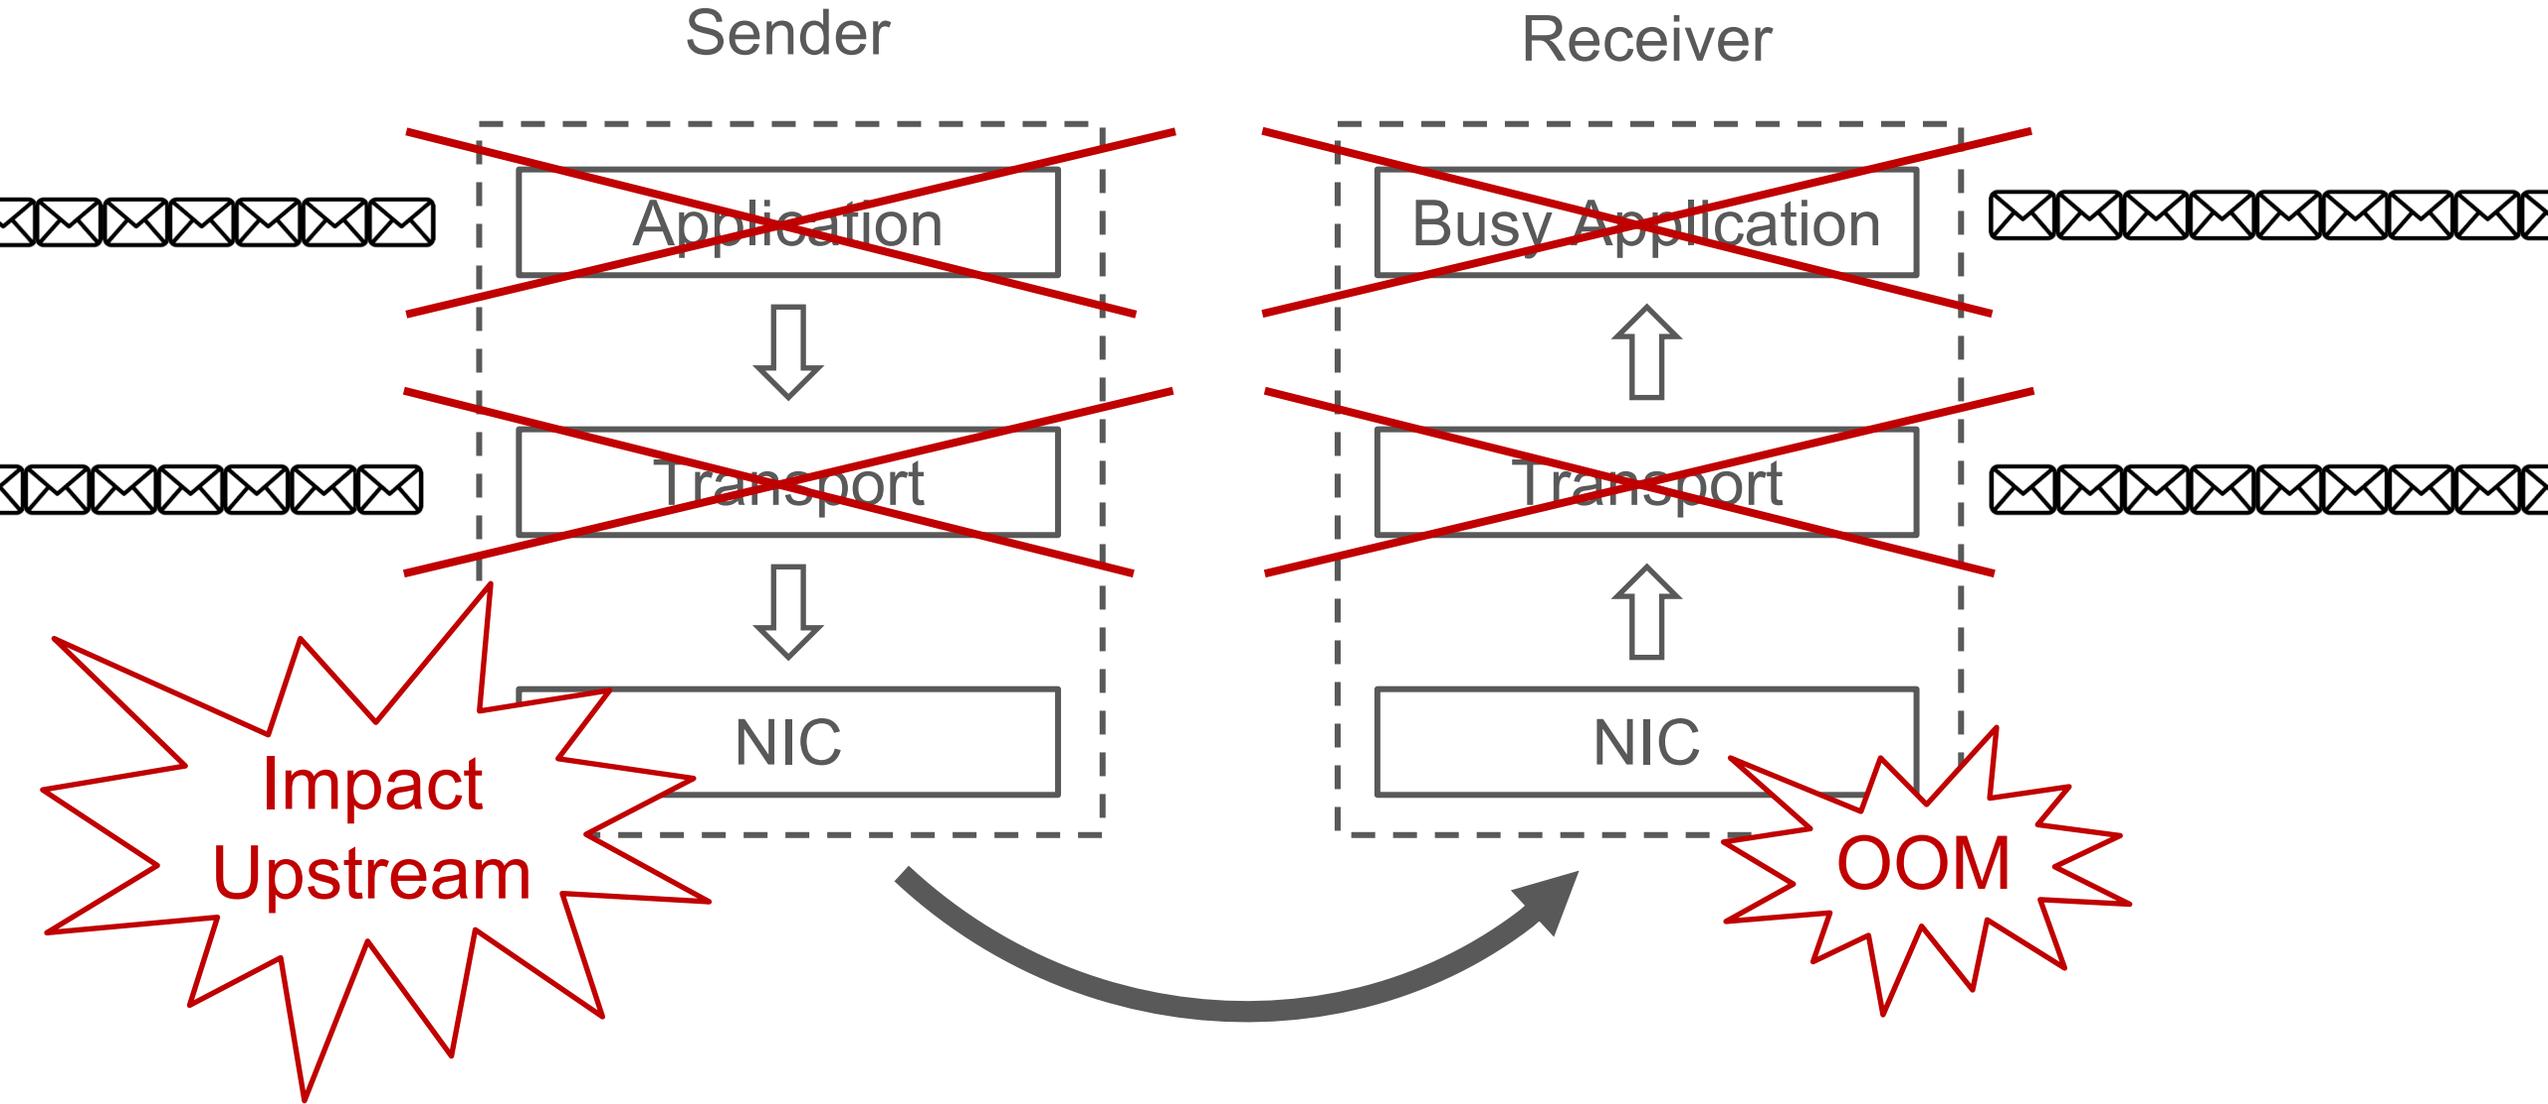

KubeCon

CloudNativeCon

North America 2019

# Solution: Push Back

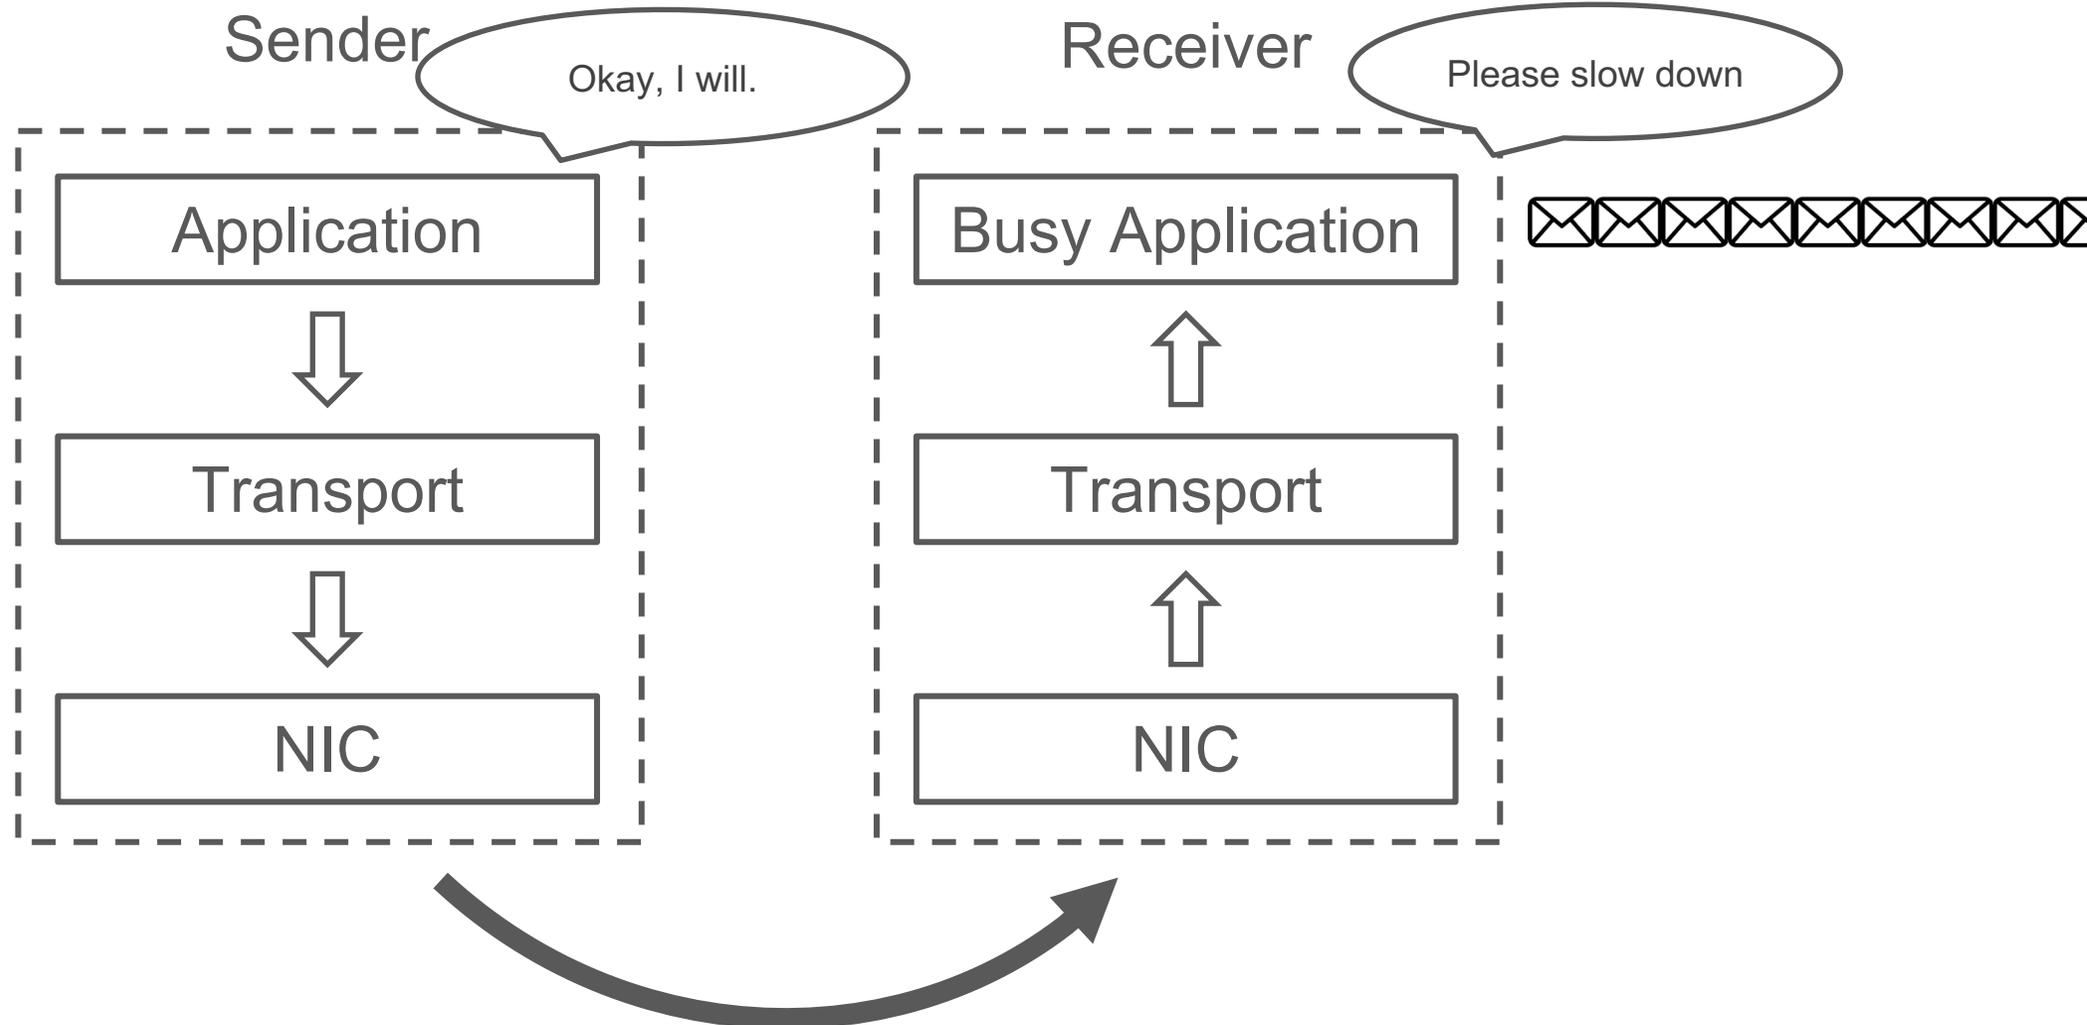

KubeCon

CloudNativeCon

North America 2019

# Without Flow Control

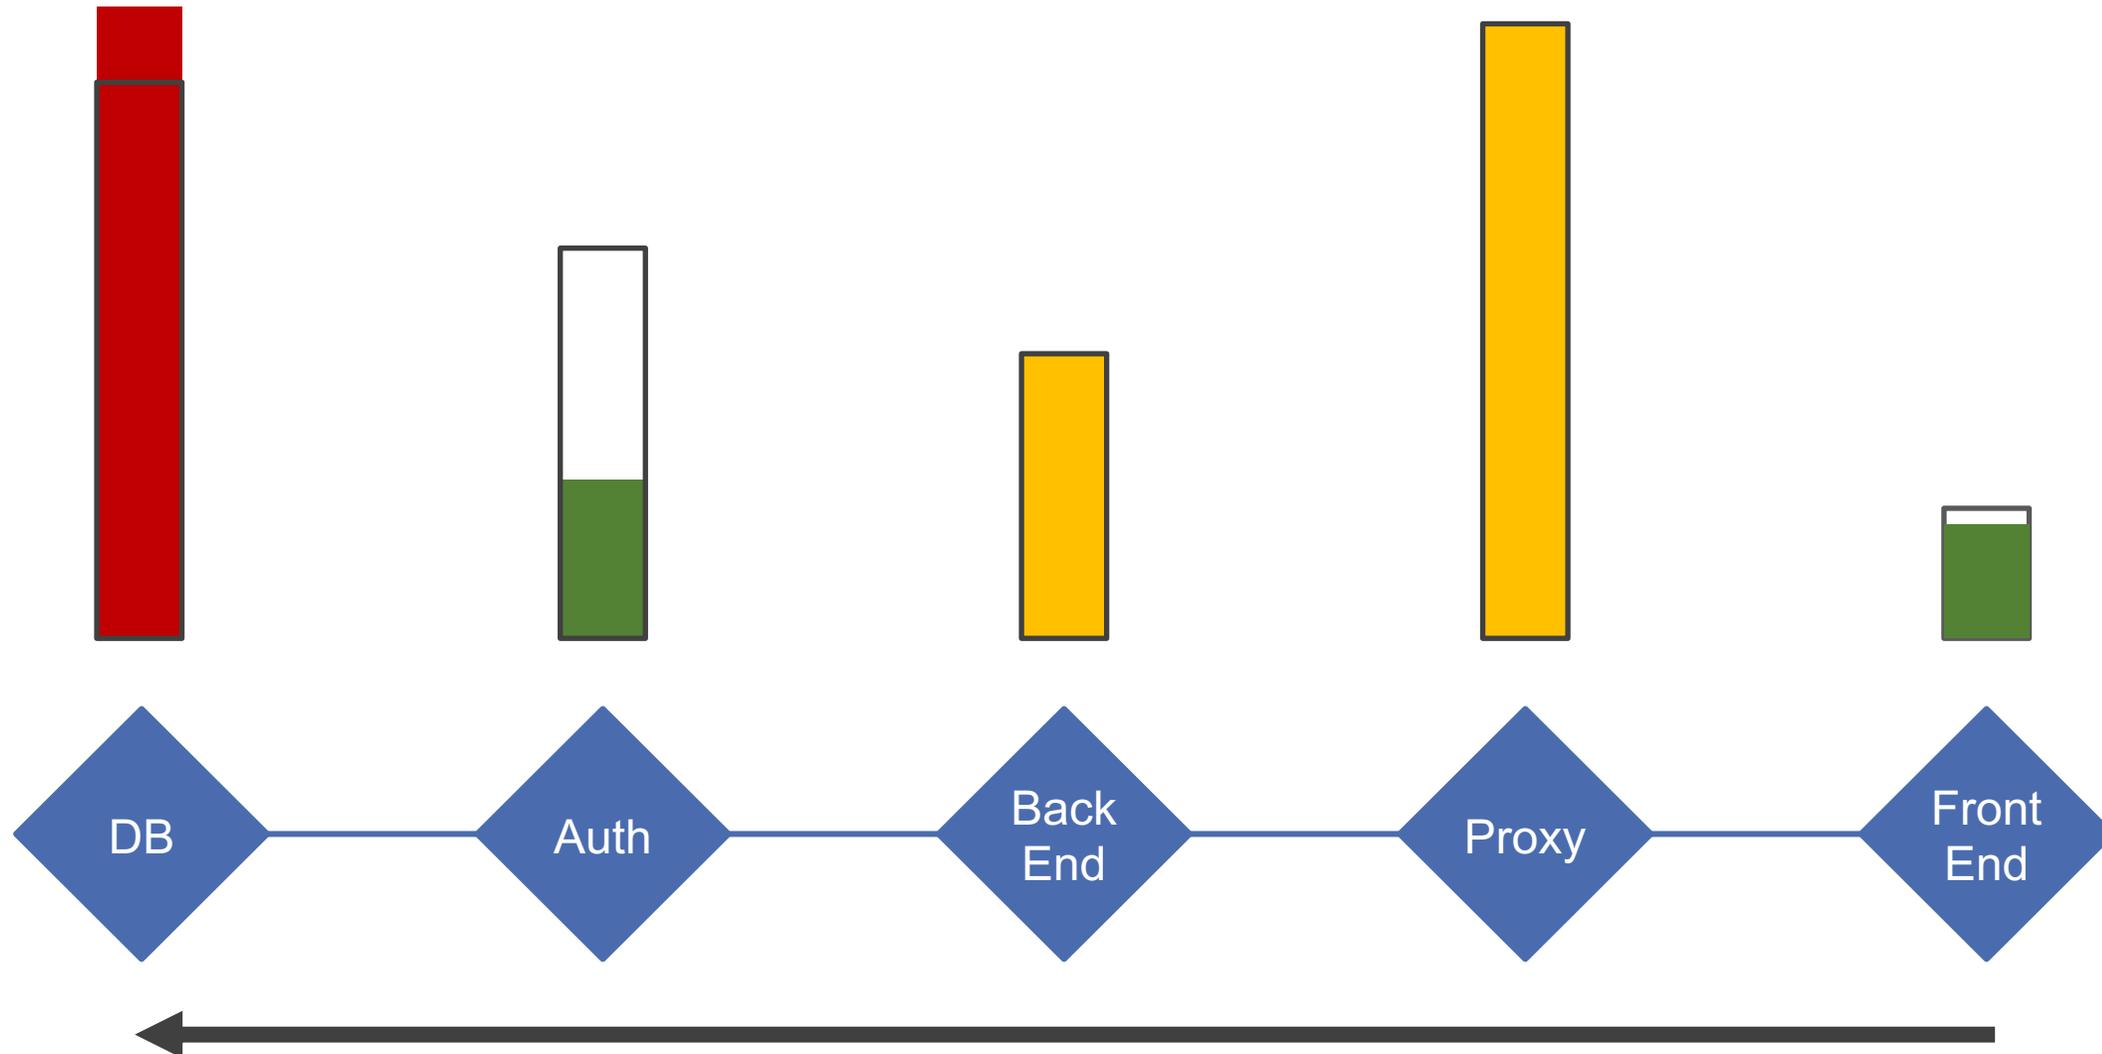

KubeCon

CloudNativeCon

North America 2019

# Without End To End Coverage

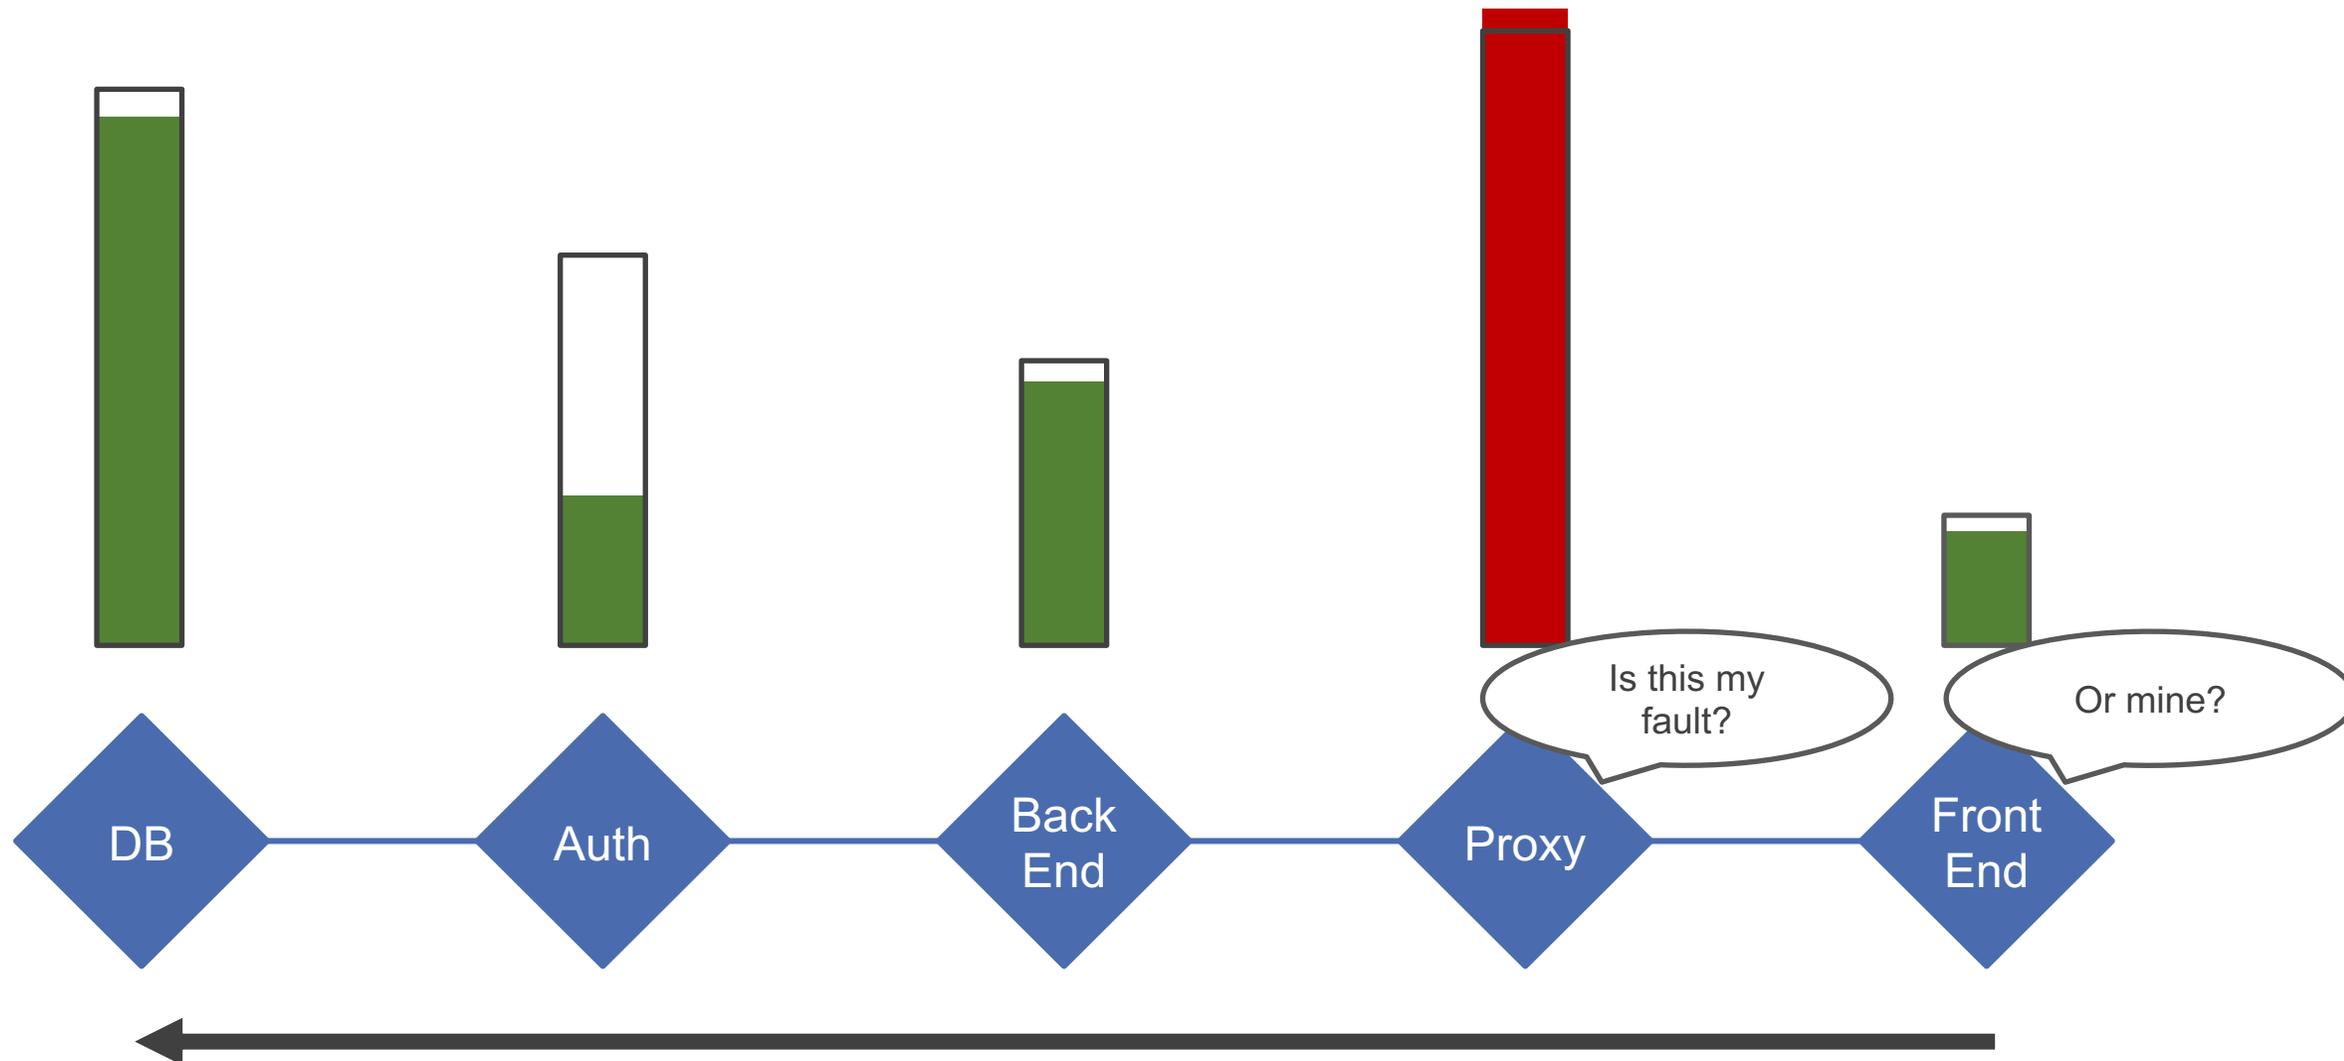

KubeCon

CloudNativeCon

North America 2019

# With Flow Control From End To End

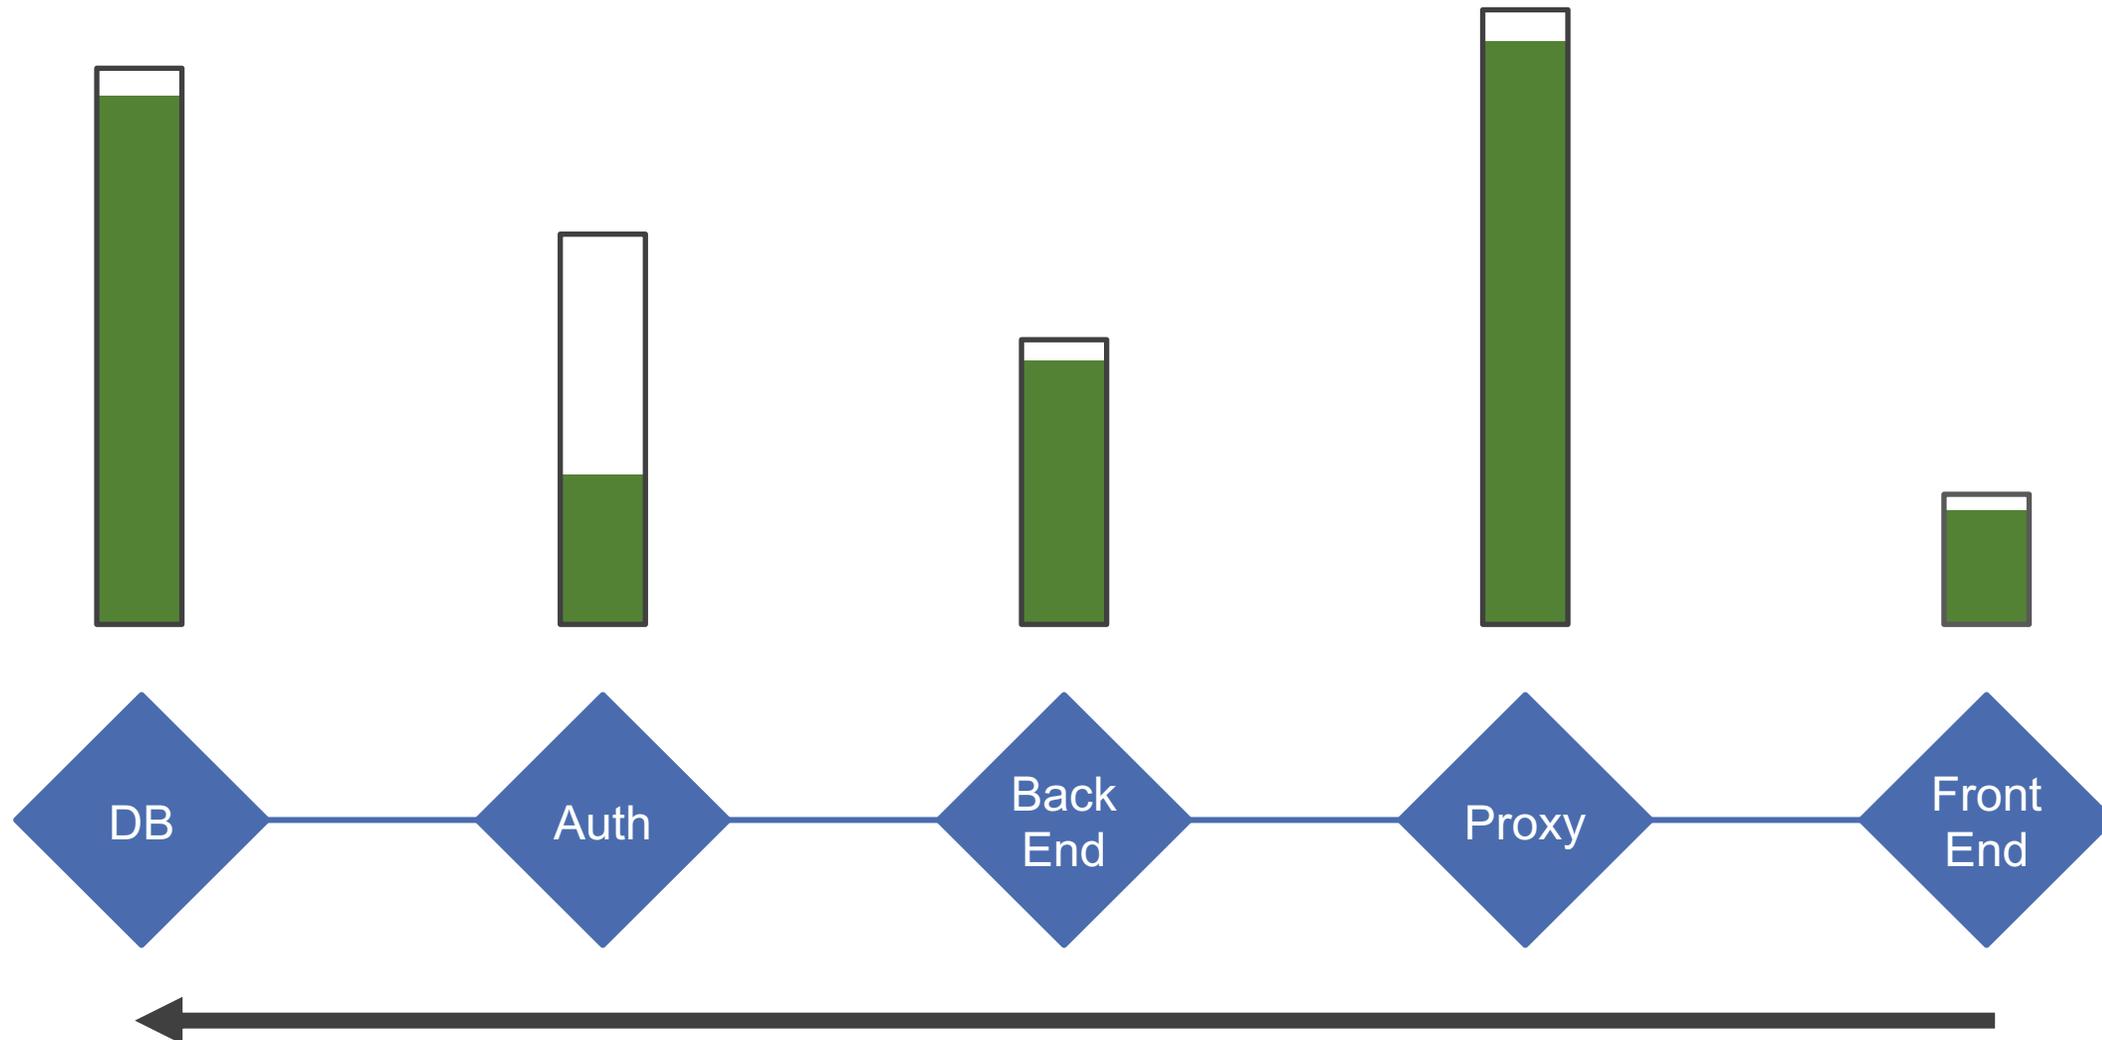

KubeCon

CloudNativeCon

North America 2019

# Challenges

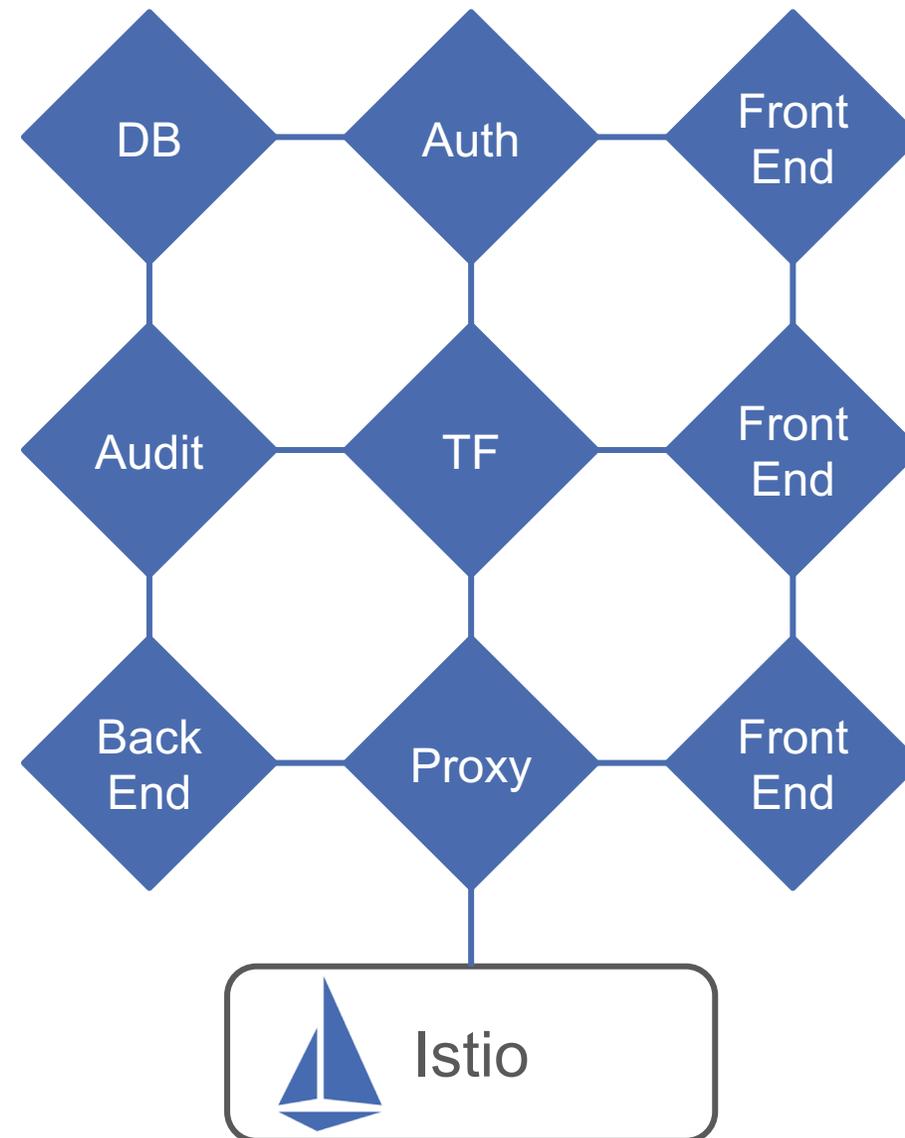

KubeCon

CloudNativeCon

North America 2019

- Need to be performant
- Fairness between RPCs
- Throttle based on performance
- **Flow Control From End To End**

# Flow Control vs. Congestion Control

KubeCon

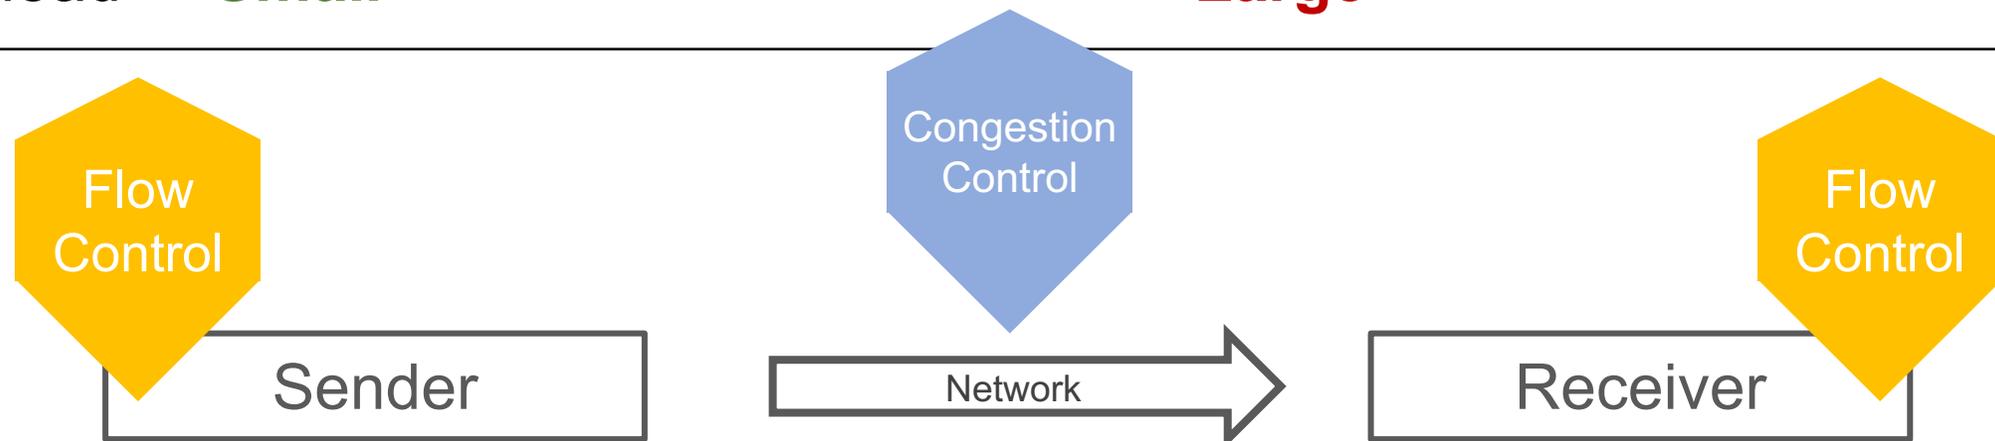

CloudNativeCon

North America 2019

**Flow Control**  **Congestion Control**

Goal	Protect receiver from overloaded	Protect the network itself
Trigger	Performance of the receiver	Bandwidth; loss rate
Overhead	<b>Small</b>	<b>Large</b>

# Example: TCP Congestion Control

KubeCon

CloudNativeCon

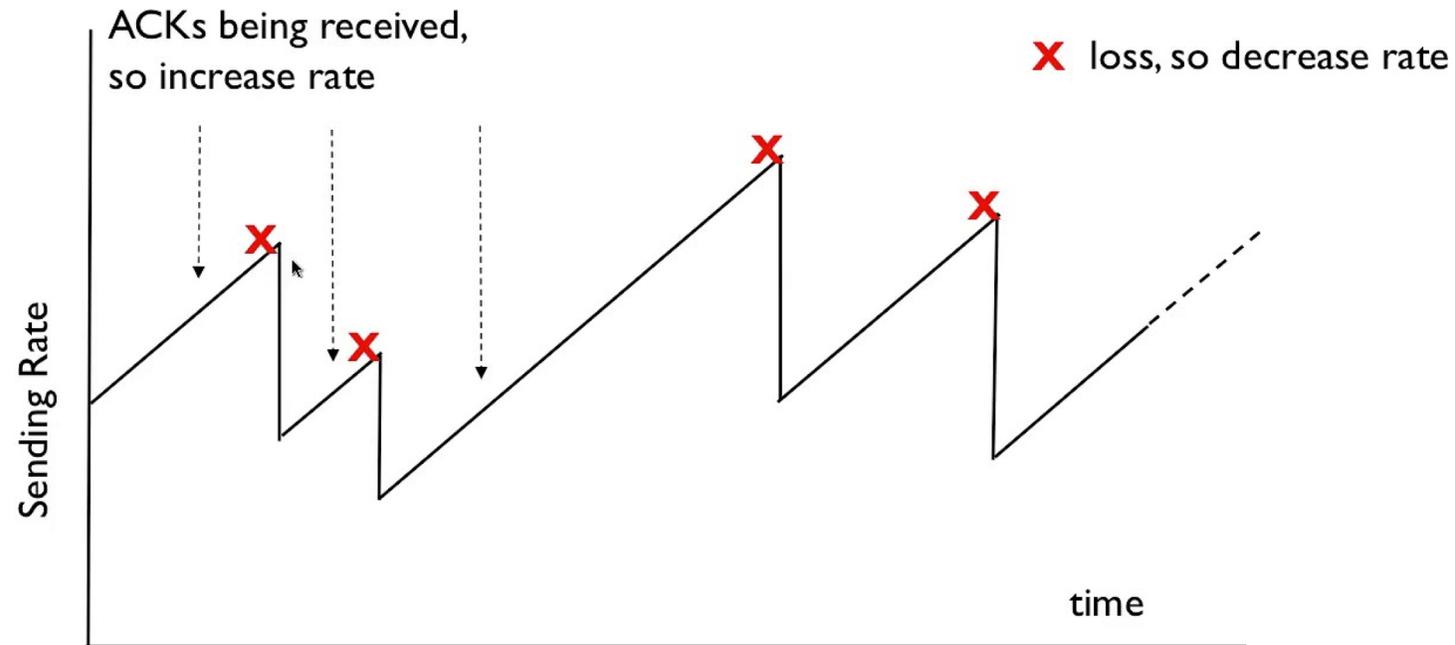

North America 2019

## Common Algorithms

- Reno
- Cubic

## General Strategy

- **Increase** sending rate if ACK
- **Decrease** if not missed

Linux Users: `cat /proc/sys/net/ipv4/tcp_congestion_control`

# Example: TCP Flow Control

KubeCon

CloudNativeCon

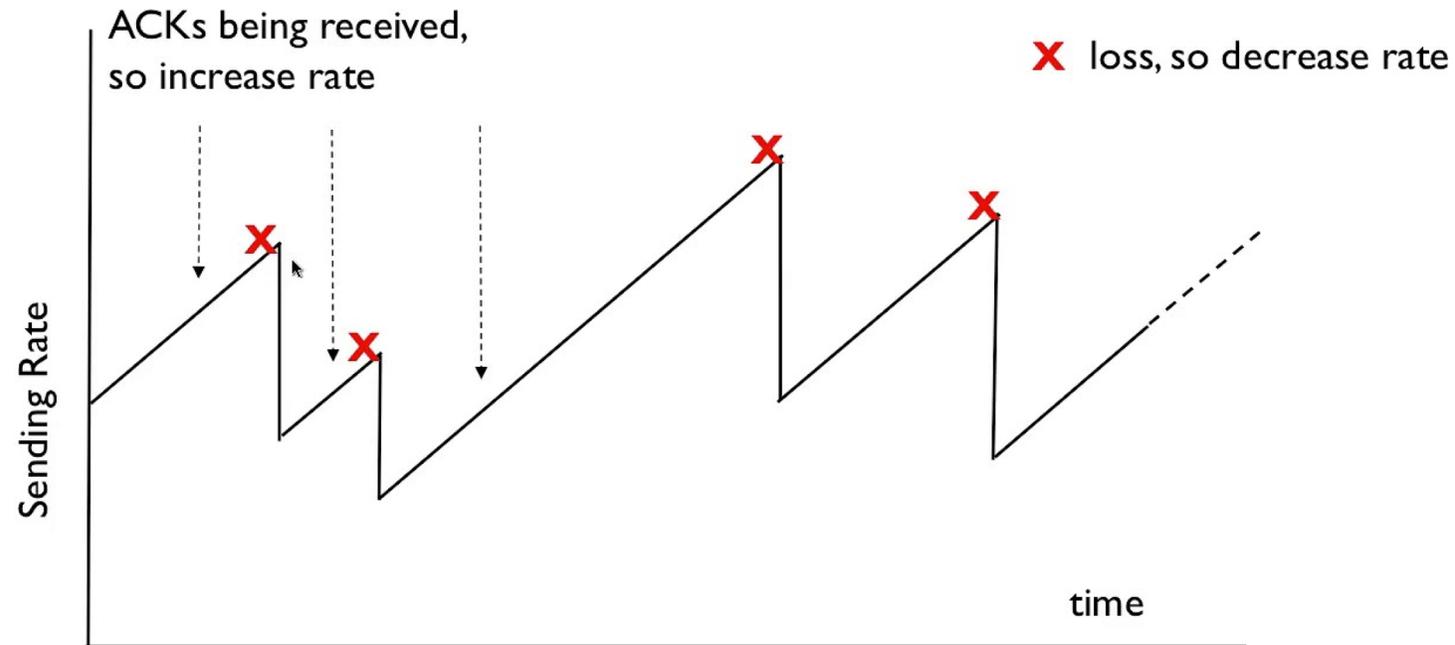

North America 2019

## TCP flow control

- Stop reading kernel buffers
- Receiver drops further packets
- Receiver being protected

## Trigger Impact

- **Reduced throughput**
- **Degraded multiplexing**

Linux Users: `cat /proc/sys/net/ipv4/tcp_congestion_control`

# Why Is Multiplexing Important?

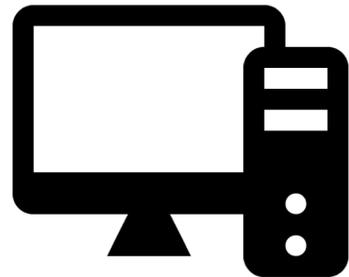

KubeCon

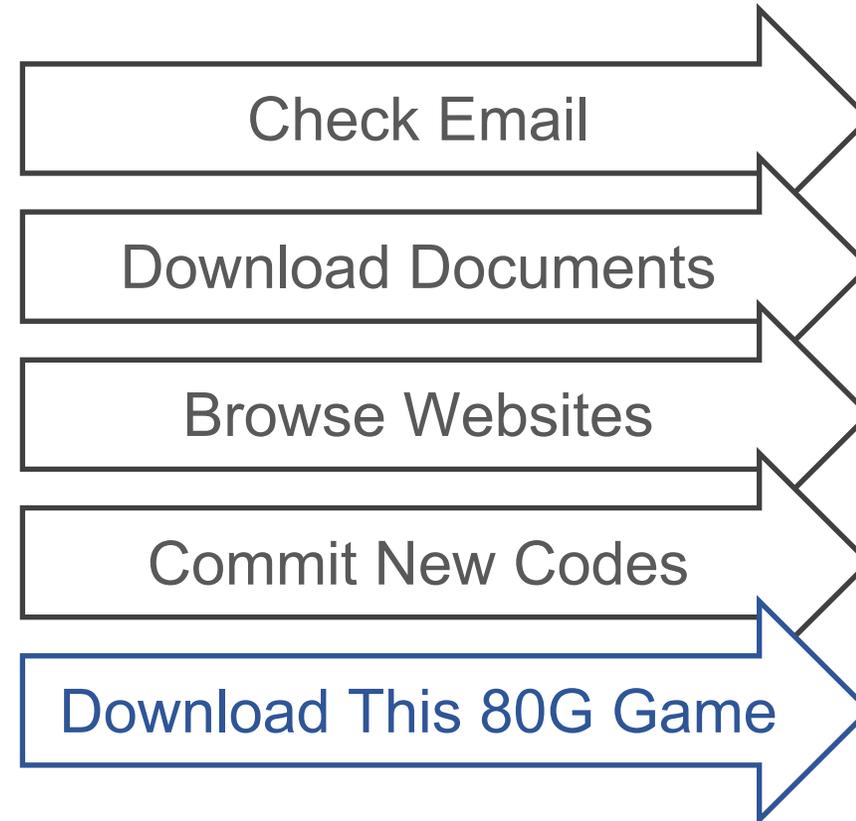

CloudNativeCon

North America 2019

Your  
Computer

Internet  
(ISP)

# HTTP/2 Flow Control

KubeCon

CloudNativeCon

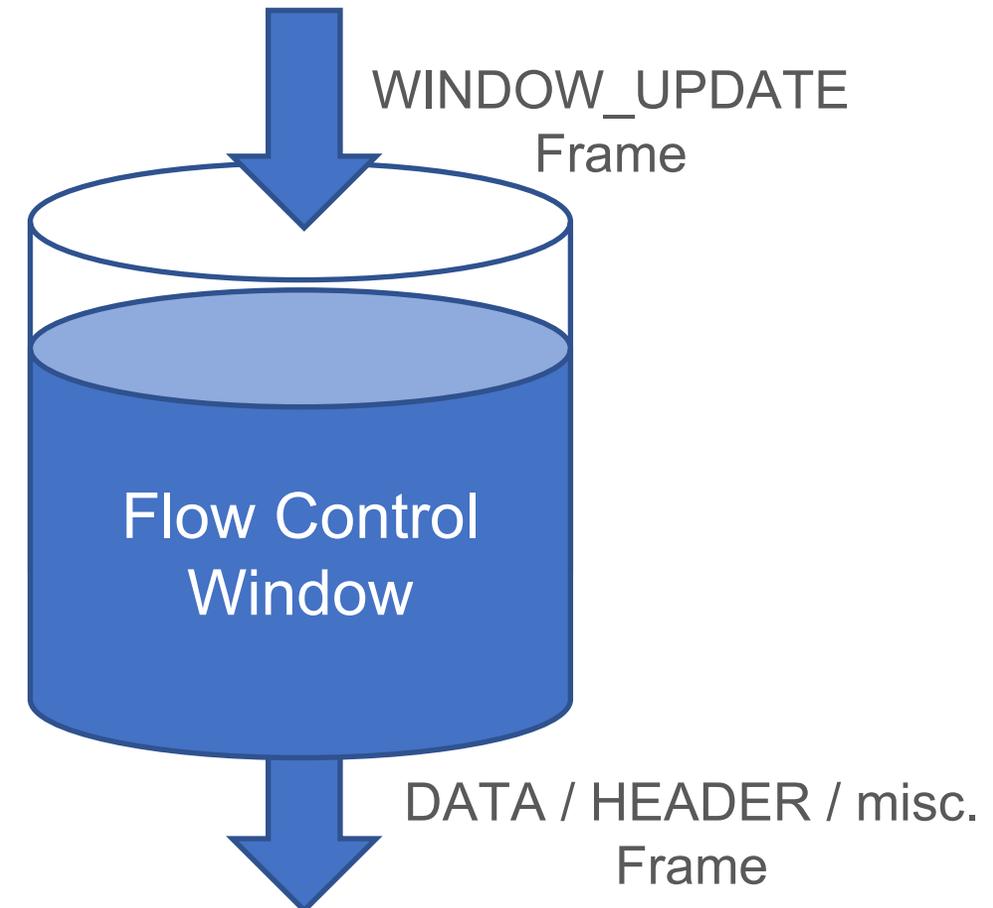

North America 2019

Algorithm similar to Token Bucket

## Features

- Highly Performant
- Fine grained throttling
  - **Stream (RPC)** / Connection
- Frame priority

Receiver: ready for more bytes

Sender: stop if quota depleted

# HTTP/2 Flow Control

KubeCon

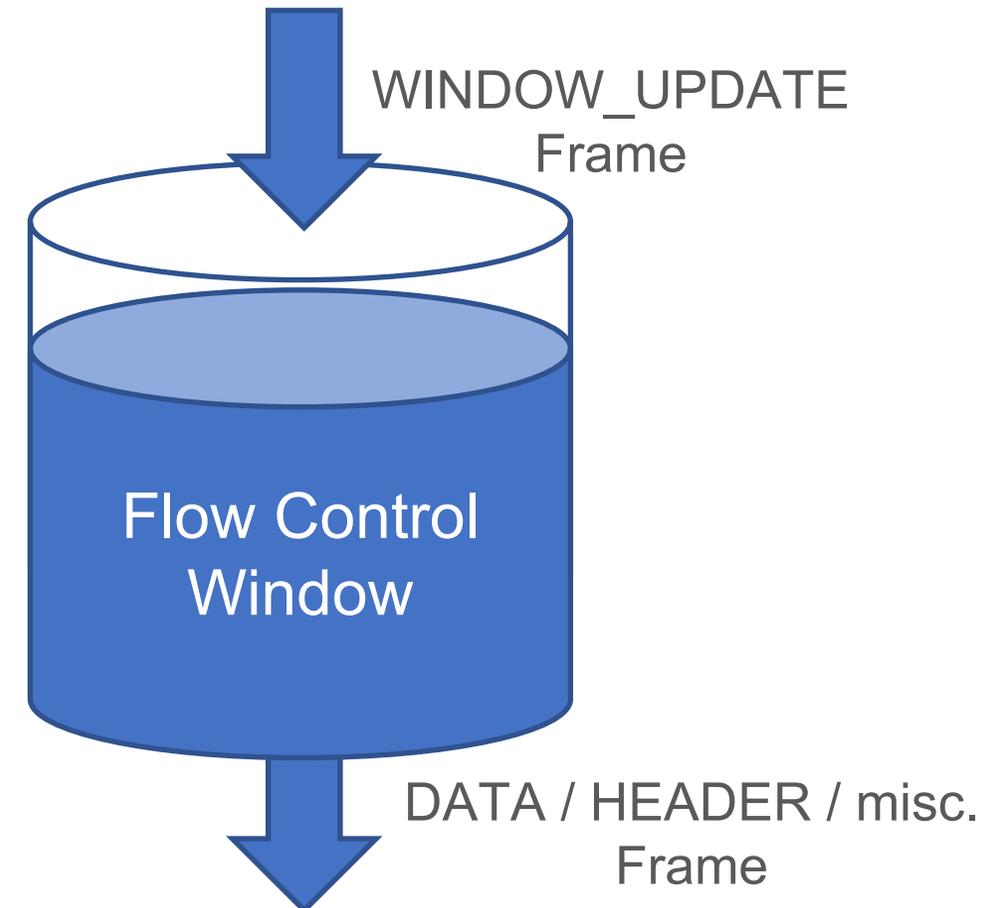

CloudNativeCon

North America 2019

*Even with full awareness of the current BDP, implementation of flow control can be **difficult**... Failure to do so could lead to a **deadlock** when critical frames... are not read and acted upon.*

From [RFC 7540 \(HTTP/2\)](#)

Receiver: ready for more bytes

Sender: stop if quota depleted

# Recap: Push Back

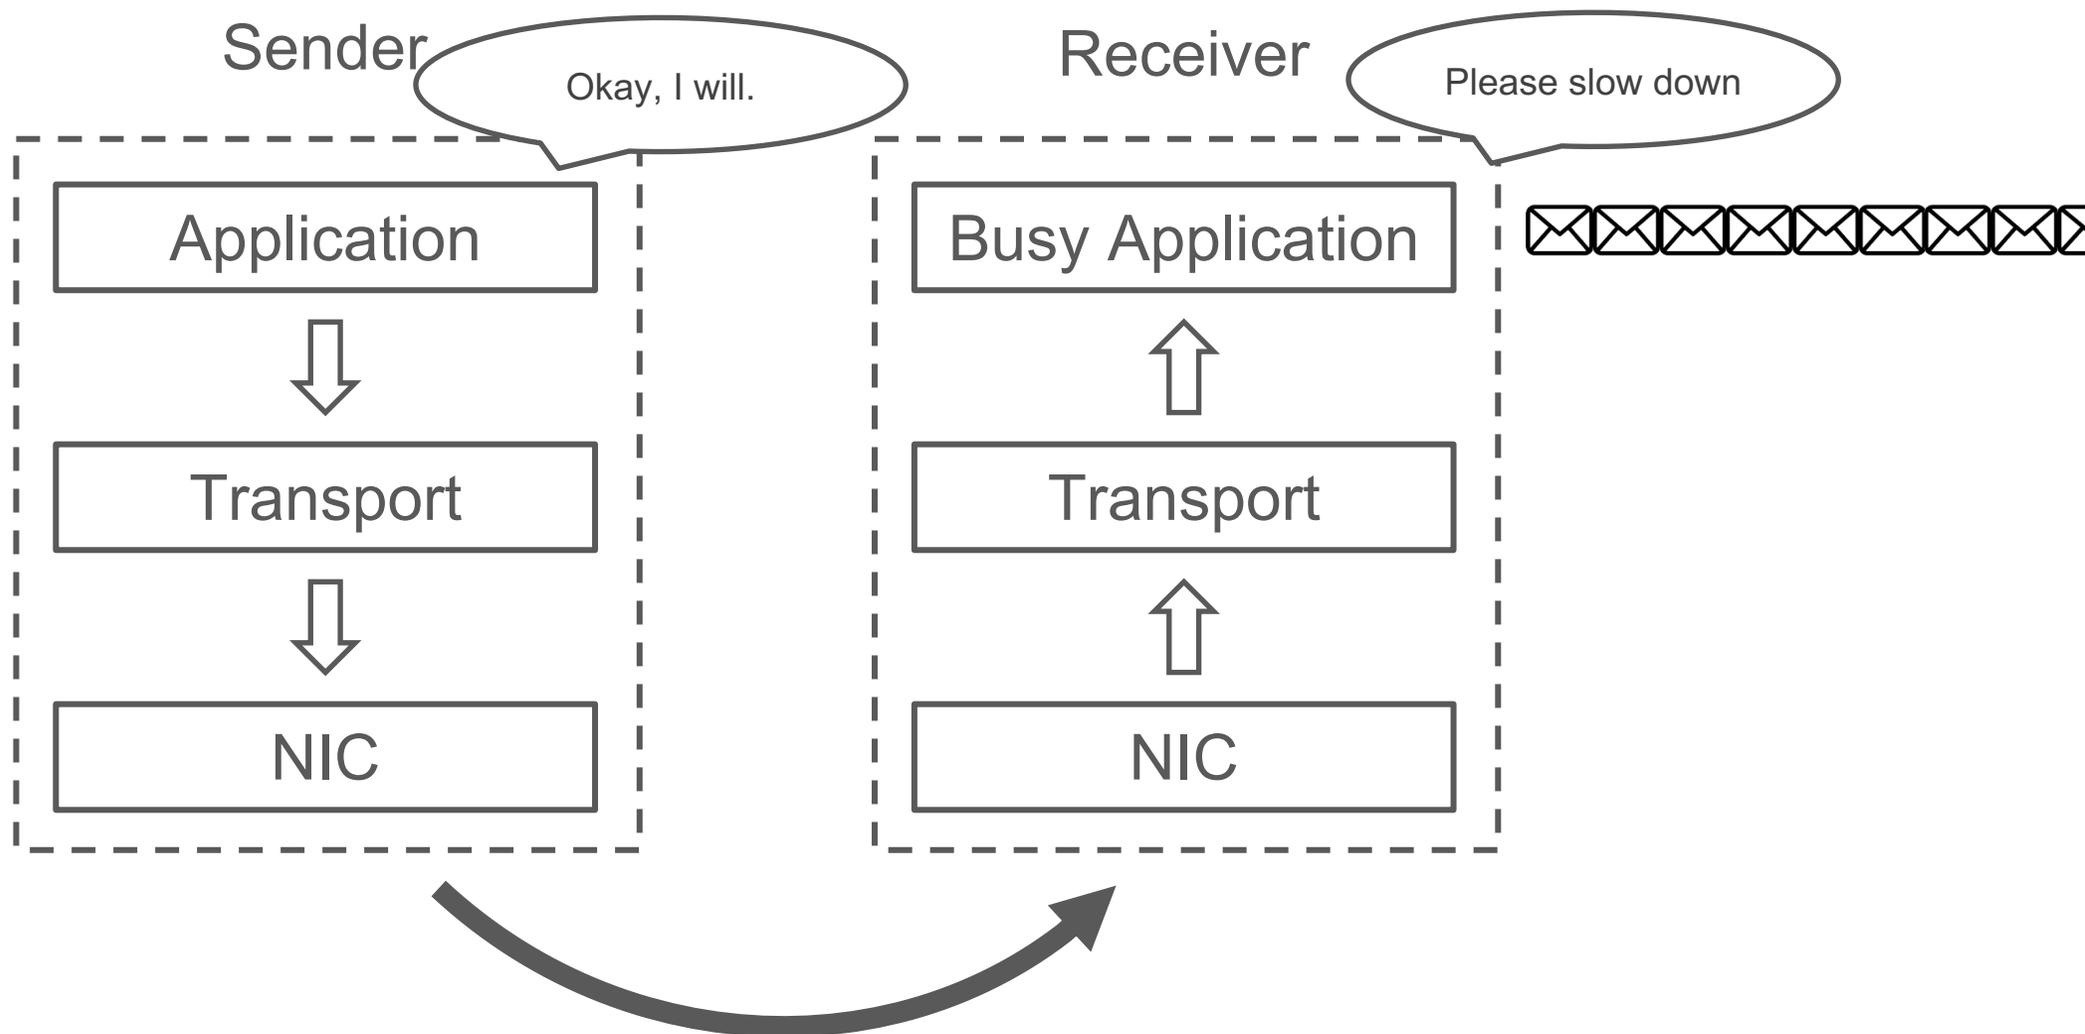

KubeCon

CloudNativeCon

North America 2019

# Solution: gRPC

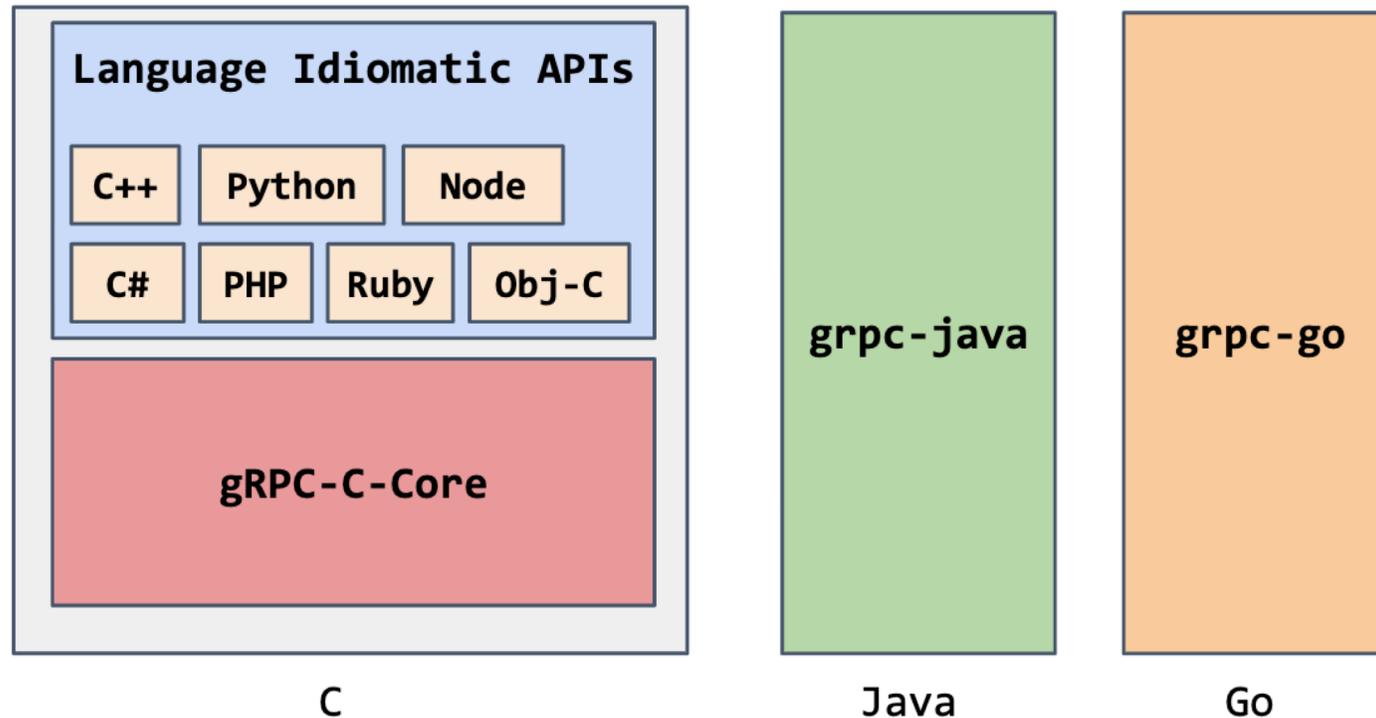

KubeCon

CloudNativeCon

North America 2019

- Natively integrated with flow control
- Streaming API aware of push backs
- Validated in Google's production

# Problem: Initial Window Size

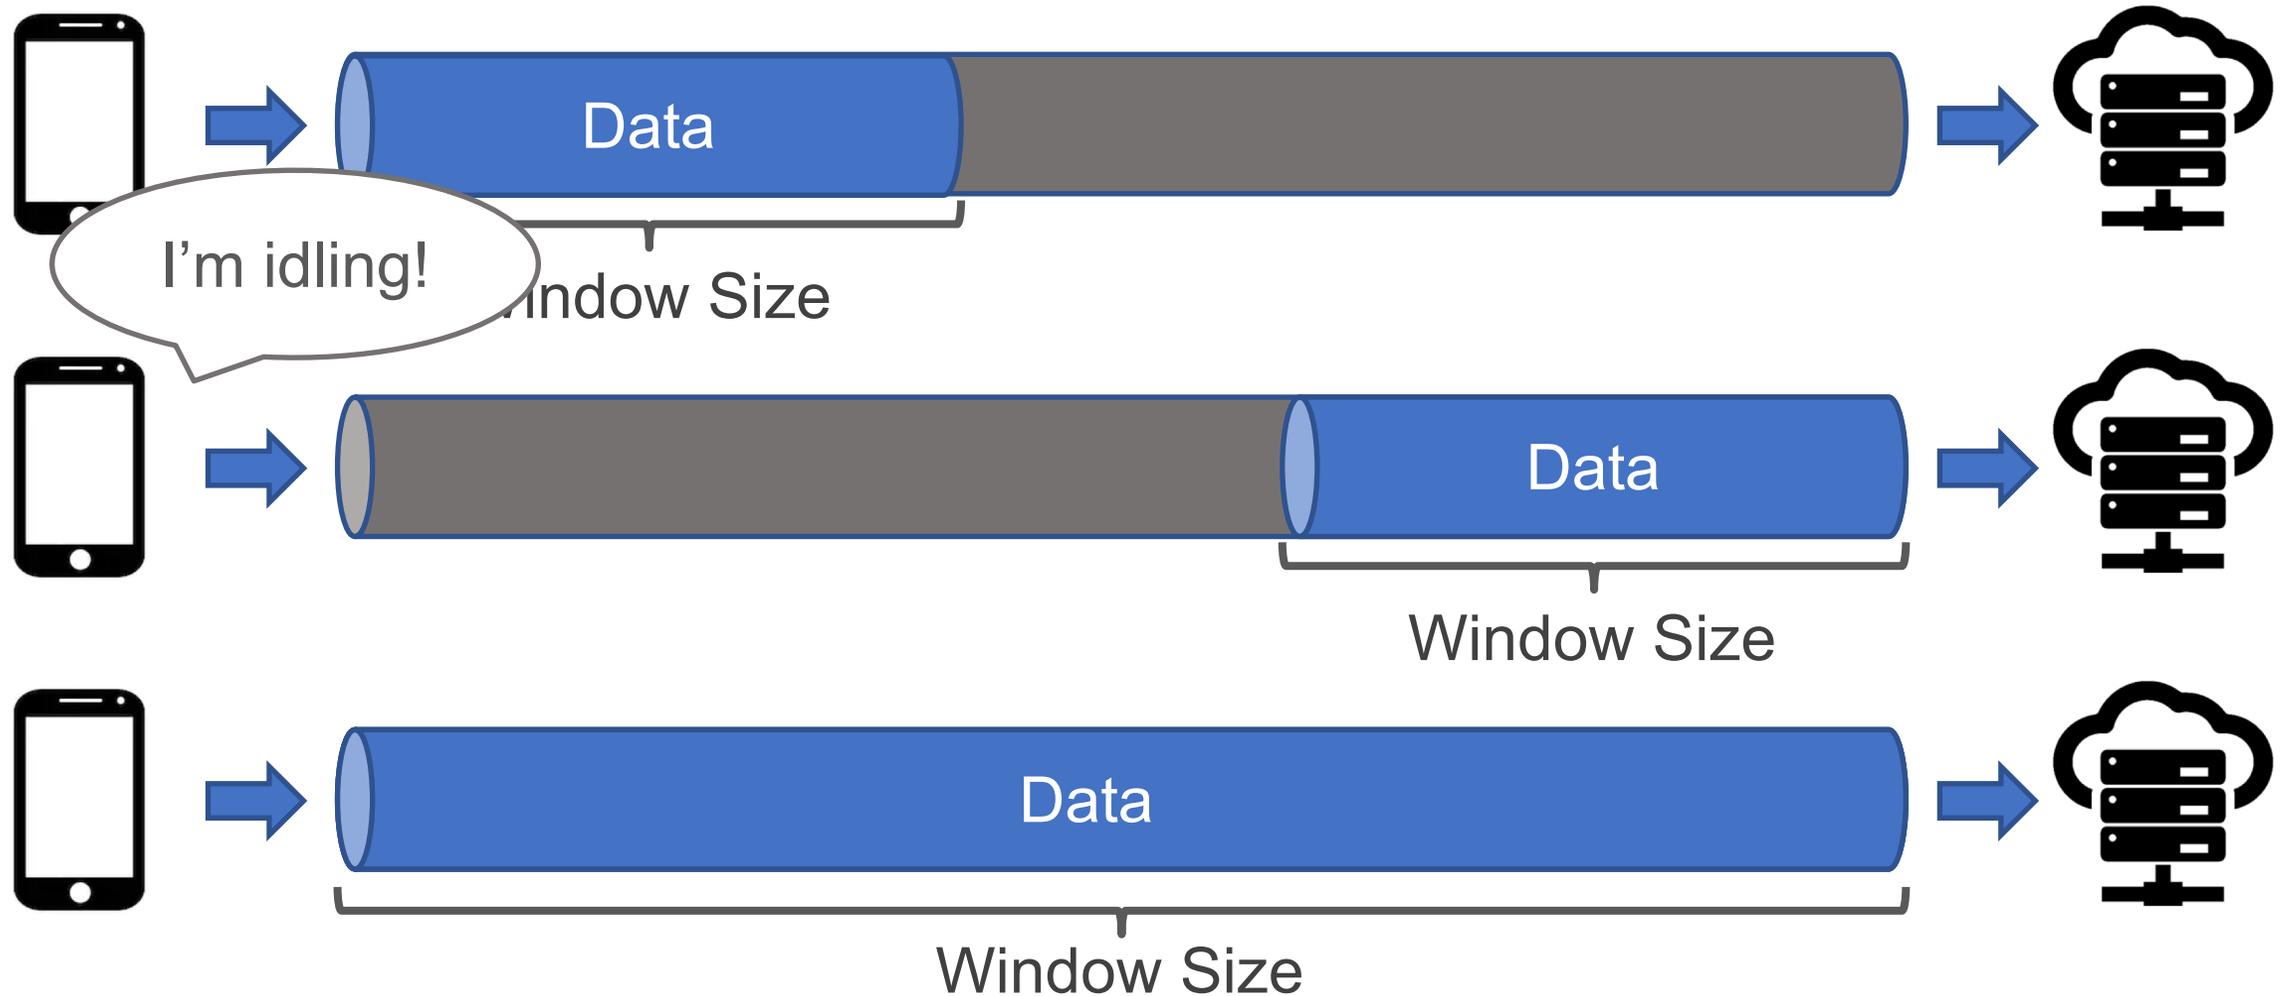

KubeCon

CloudNativeCon

North America 2019

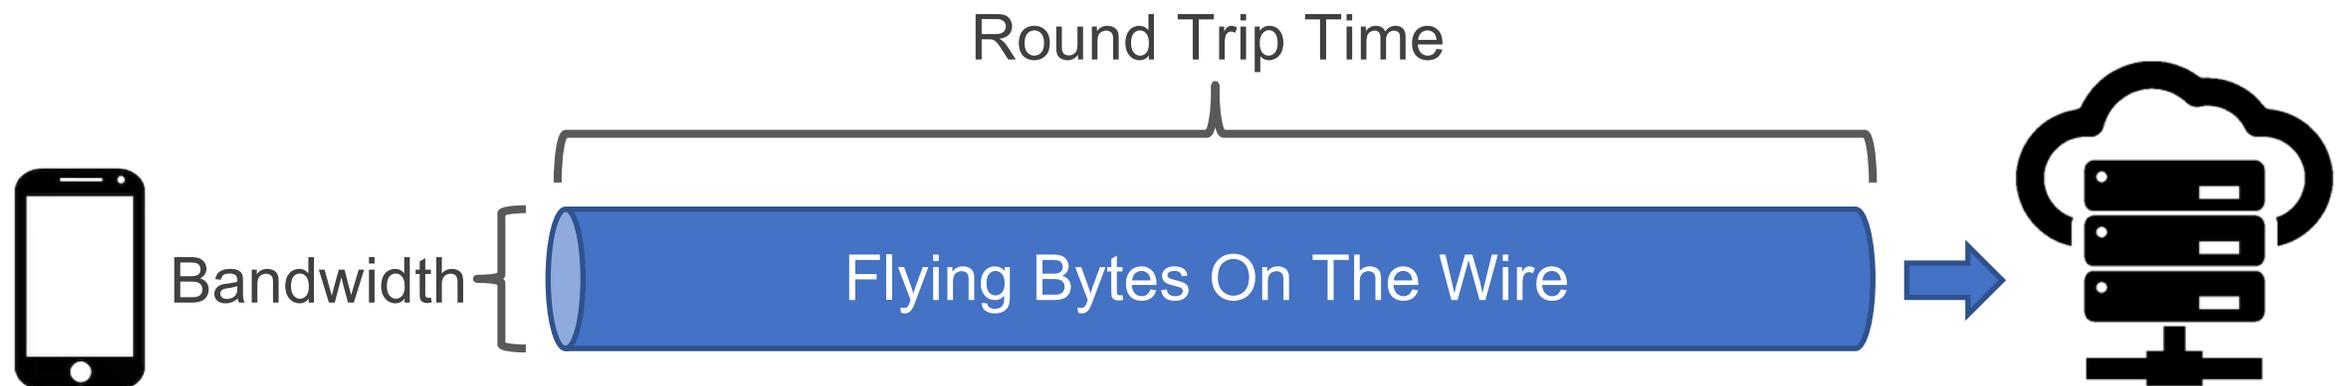

# Solution: BDP Estimation

**Goal:** Intelligently avoid triggering flow control

*Bandwidth Delay Product: the amount of data that can be in transit in the network.*

- Turned on in C-Core / Golang
- Measures BDP through PING frames and a [PID controller](#)
- Sets the initial window size to BDP

# Recap: Challenges

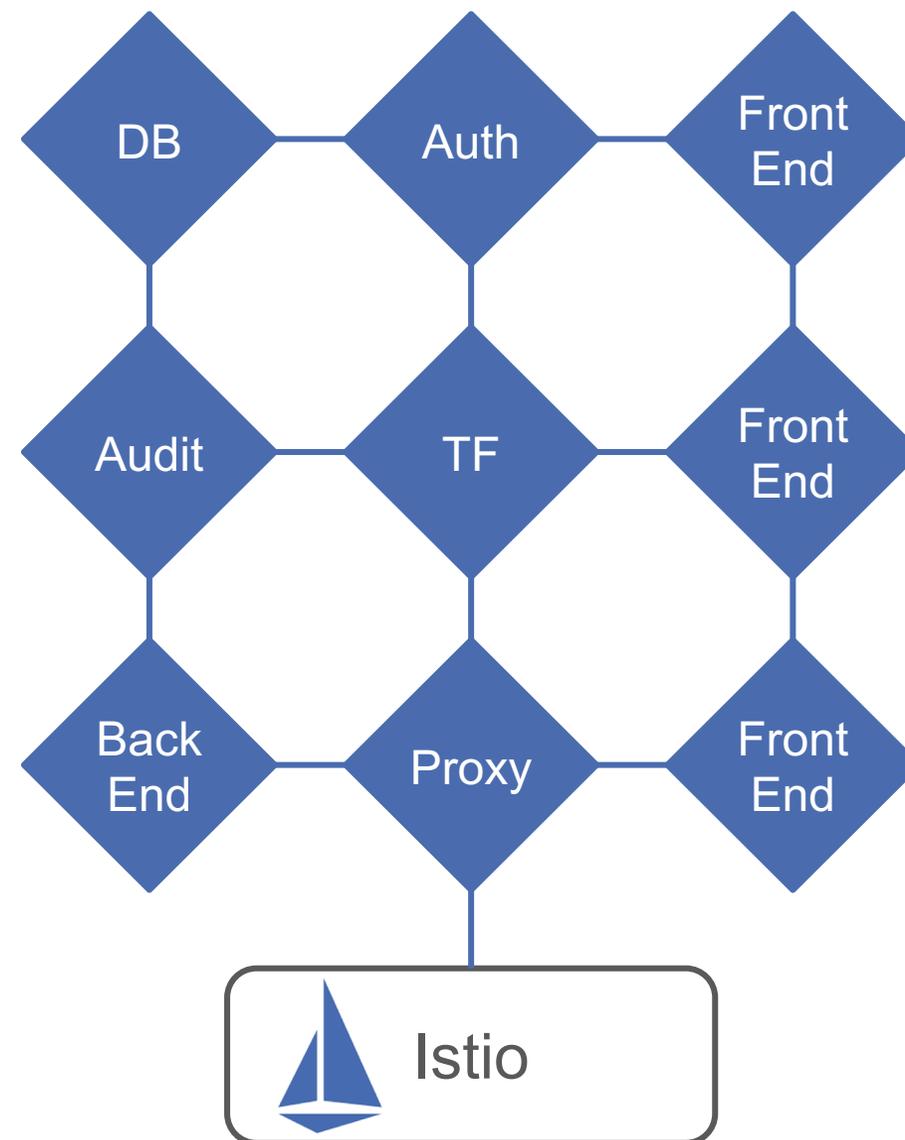

KubeCon

CloudNativeCon

North America 2019

- gRPC is performant
- HTTP2 flow control supports multiplexing
- gRPC has better performance
- gRPC has built-in Flow Control
- Solved by gRPC 😊

# Snippet: gRPC Go

KubeCon

CloudNativeCon

North America 2019

```
func streaming(client pb.RouteGuideClient) {
    stream, err := client.RouteChat(context.Background())
    if err != nil {
        log.Fatalf("Error calling RouteChat: %v", client, err)
    }
    go func() {
        for {
            in, err := stream.Recv()
            // ...we don't care about receiving
        }
    }()
    for _, note := range notes {
        if err := stream.Send(note); err != nil {
            log.Fatalf("Failed to send a note: %v", err)
        } // Blocks if peer pushes back
    }
    stream.CloseSend()
}
```

# Snippet: gRPC Python

KubeCon

CloudNativeCon

North America 2019

```
def RouteChat(self, request_iterator, context):
    prev_notes = []
    for new_note in request_iterator:
        for prev_note in prev_notes:
            if prev_note.location == new_note.location:
                yield prev_note # Blocks if peer pushes back
        prev_notes.append(new_note)
```

# Snippet: gRPC Java

KubeCon

CloudNativeCon

North America 2019

## Inbound Traffic

- Automatic flow control
- Won't request next message until the existing one is consumed

## Outbound Traffic

- `isReady()`
- `setOnReadyHandler()`

```
StreamObserver<TestResponse> inboundObserver =
    new StreamObserver<TestResponse>() {
        @Override
        public void onNext(TestResponse value) {
            // Your callback to be executed whenever a TestResponse is received
        }

        @Override
        public void onError(Throwable t) {
            // Your callback to be executed if the server ends the RPC with an error
            // e.g. a trailer with non-OK status
            Status status = Status.fromThrowable(t);
            String description = status.getDescription();
            Status.Code code = status.getCode();
        }

        @Override
        public void onCompleted() {
            // Your callback to be executed if the server ends the RPC normally
            // e.g. a trailer with OK status
        }
    };

final ServerCallStreamObserver responseObserver = (ServerCallStreamObserver) responseObserver;
responseObserver.setOnReadyHandler(new Runnable() {
    @Override
    public void run() {
        while (responseObserver.isReady()) {
            responseObserver.onValue(someResponse);
        }
    }
});
```

# Advanced: gRPC Message Buffering

KubeCon

CloudNativeCon

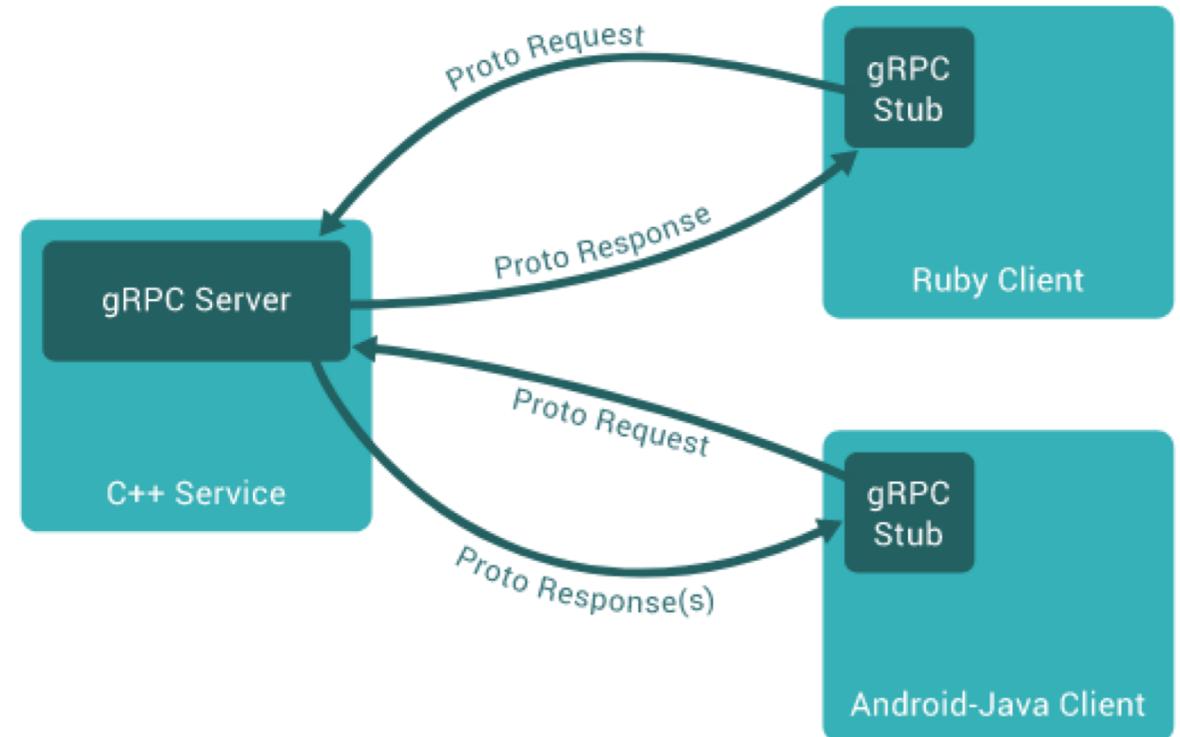

North America 2019

## Special Scenarios

- E.g. Short-Bursts of Huge Queries

## Alternatives

- Implement application layer buffer
- Let gRPC queue the messages
  - Core / Java Only

# Advanced: C-Core Based Implementations

KubeCon

CloudNativeCon

North America 2019

```
/// Sets flag indicating that the write may be buffered and need not go out on
/// the wire immediately.
///
/// \sa GRPC_WRITE_BUFFER_HINT
inline WriteOptions& set_buffer_hint() {
    SetBit(GRPC_WRITE_BUFFER_HINT);
    return *this;
}
```

```
/** How much data are we willing to queue up per stream if
| GRPC_WRITE_BUFFER_HINT is set? This is an upper bound */
#define GRPC_ARG_HTTP2_WRITE_BUFFER_SIZE "grpc.http2.write_buffer_size"
```

```
/** Should BDP probing be performed? */
#define GRPC_ARG_HTTP2_BDP_PROBE "grpc.http2.bdp_probe"
```

# Advanced: gRPC Java

KubeCon

CloudNativeCon

North America 2019

## Inbound Traffic

- Disable flow control before start
- Needs to call `request(int)`

## Outbound Traffic

- Ignoring the `isReady()` flag
- **Infinite buffering!**

```
ClientResponseObserver<TestRequest, TestResponse> inboundObserver =
    new ClientResponseObserver<TestRequest, TestResponse>() {
        @Override
        public void beforeStart(
            ClientCallStreamObserver<TestRequest> outboundObserver1) {
            // turn off automatic flow control
            outboundObserver1.disableAutoInboundFlowControl();
        }
        // other @Override methods
    };
// Store this reference somewhere
ClientCallStreamObserver<TestRequest> outboundObserver2 =
    (ClientCallStreamObserver) testServiceStub
        .testBidiStreaming(inboundObserver);
outboundObserver2.request(numMessages);
```

# Take-Away

KubeCon

CloudNativeCon

North America 2019

- What is Flow Control?
  - Flow control throttles the traffic to **protect endpoints**
- Why is Flow Control important?
  - Faster senders may cause **excessive buffering** on both sides
- How gRPC solves it?
  - gRPC provides **easy-to-use** build-in flow control

**KubeCon**

**CloudNativeCon**

North America 2019

# Q&A
