OpenCensus and Istio

Morgan McLean - Product Manager, Google
Varun Talwar - Founder, Startup

This was an image of the 2001: Space Odyssey monolith, but it's probably copyrighted so I removed it

Critical instrumentation:

Understanding how the system works

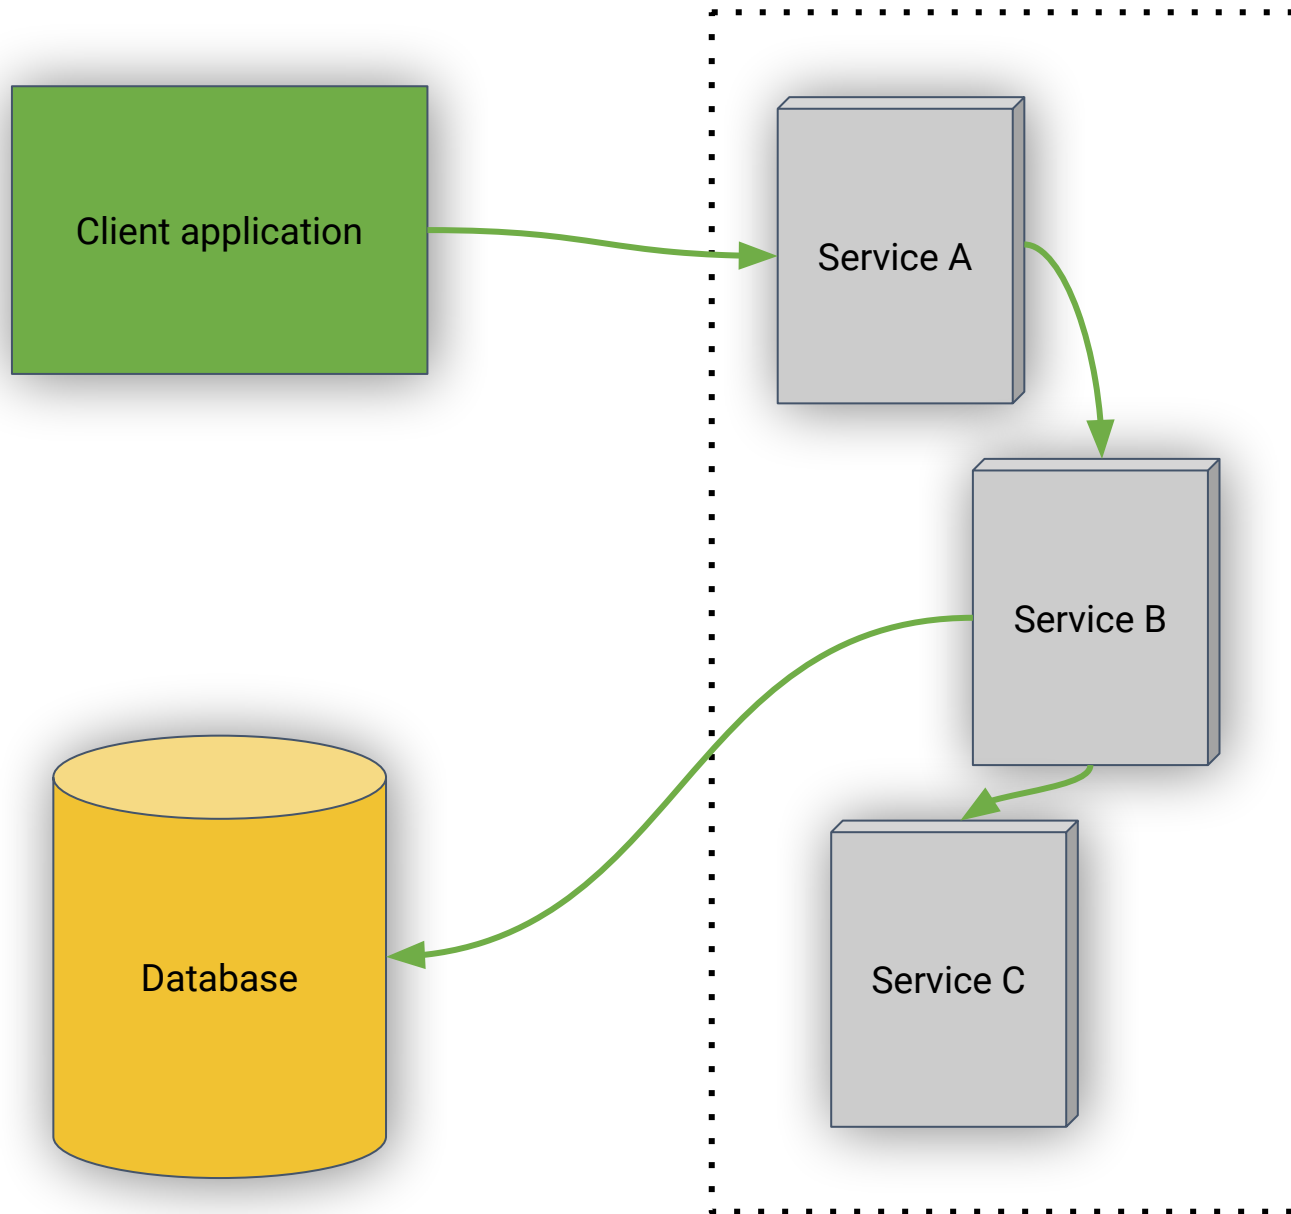

- Static code analysis
- Local debugging

Basic monitoring

- System-level metrics:
 - CPU consumption
 - Memory consumption
- Application-level metrics:
 - Endpoint latency
 - Custom metrics
- Logs

Performance tuning

- Offline / local testing
- Offline / local debugging
- Profiling
- Non-distributed "transaction" traces

Critical instrumentation:

Understanding how the system works

- Distributed tracing

Basic monitoring

- System-level metrics:
 - CPU consumption
 - Memory consumption
- Application-level metrics:
 - Endpoint latency of each node
 - RPC stats
 - Custom metrics
- Logs

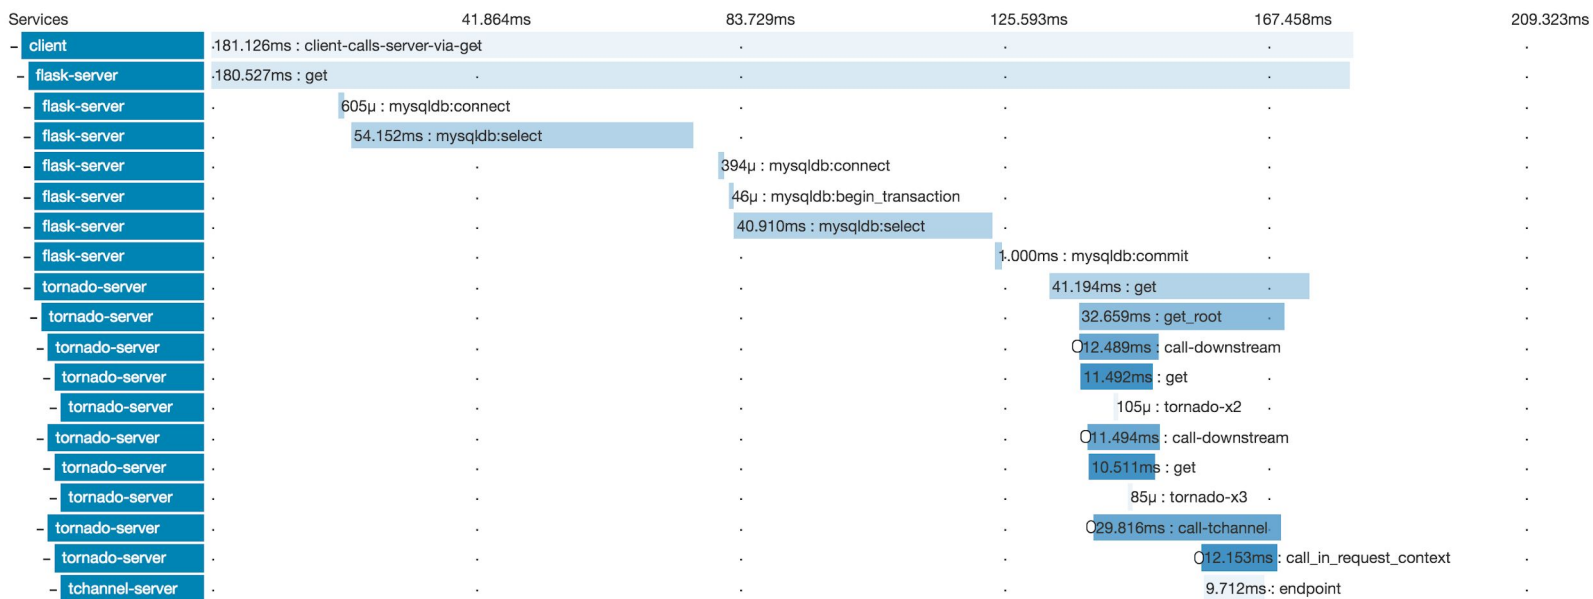

Performance tuning

- Distributed tracing
- Production debugging
- Continuous profiling

Duration: **209.323ms** Services: **5** Depth: **7** Total Spans: **24** [JSON](#)

Distributed tracing gives us:

- Application topology
- A view into *how* certain requests are handled
- An understanding of where the system is performing poorly
- An understanding of where errors are occurring
- Correlation / context for other signals like logs, errors, metrics, profiles, etc.

Application metrics give us:

- Latency, RPC stats at every level of the stack
- Custom metrics

Why is this hard?

KubeCon

CloudNativeCon

Europe 2018

- Ideally, traces and stats should be automatic for each RPC
 - This requires integrations with every language, RPC framework, storage client, API client, etc.
 - Projects like OpenCensus and OpenTracing are targeting this
- Libraries vs. agents?
 - Agents can be very slick
 - Libraries can be managed through source control, have less 'magic', and provide an API

What does OpenCensus provide?

KubeCon

CloudNativeCon

Europe 2018

- An implementation for tracing, application stats, and tags targeting 8 languages
 - **C++**, **Java**, **Go**, Python, PHP, Ruby, *.Net*, *node.js*
 - Integrations with web / RPC frameworks, storage clients, etc.
 - APIs for interacting with spans, stats, tags
 - Exporters
- Realtime unsampled analysis with z-pages

TraceZ Summary

Span Name	Running	Latency Samples									Error Samples
		[>0us]	[>10us]	[>100us]	[>1ms]	[>10ms]	[>100ms]	[>1s]	[>10s]	[>100s]	
HttpServer/traceconfigz	0	0	0	0	0	0	0	0	0	0	0
HttpServer/tracez	1	0	0	0	0	1	0	0	0	0	0
Recv.helloworld.Greeter.SayHello	0	0	10	10	10	7	1	0	0	0	0

Span Name: Recv.helloworld.Greeter.SayHello

- Tags are key value pairs that are used to store information about metrics
- Define your dimensions and view recorded data by dimensions
- Very powerful concept
 - *ip=10.32.103.12*
 - *user-agent=curl/1.0*
 - *coupon=discount-1f1acdbe3*

How does this work at Google?

KubeCon

CloudNativeCon

Europe 2018

Tracing at Google is automatically built into every service, made possible by Google's internal platform

GRPC

OpenCensus + Istio

KubeCon

CloudNativeCon

Europe 2018

Envoy

- Configuration for Envoy stats
- Application and Envoy level Tracing + exporters

Mixer

- Aggregation
- Provide Mixer adapter for OpenCensus that generates trace spans from Mixer report calls. (Planned for summer)
- OC Lib
 - Tags, Pass headers

Doesn't Envoy Provide This?

KubeCon

CloudNativeCon

Europe 2018

Yes, but:

- You have to perform correlations yourself
- No automatic spans from client libraries
- You can't create custom spans, stats, tags, etc.
- No z-pages

Use OpenCensus for app instrumentation, builtin Envoy tracer for additional spans

OpenCensus + Istio

Hello World

gRPC and OpenCensus example

Code here: <https://github.com/rakyll/opencensus-grpc-demo>

What's coming next?

KubeCon

CloudNativeCon

Europe 2018

Istio + OpenCensus

- Completing Envoy support
- Mixer adapter for OpenCensus

OpenCensus

- More integrations: MongoDB, Spring, etc.
- Completing libraries across all 8 languages
- Client-side instrumentation for mobile and web apps
- More intelligent sampling
- Logs? Profiles? Errors?
