# What About Docker?

Is docker vulnerable to these kinds of attacks?

KubeCon

CloudNativeCon

Europe 2019

A long time ago  
(in technology terms)...

# Signing Docker Images

KubeCon

CloudNativeCon

Europe 2019

Docker content trust integrates TUF in order to sign and protect Docker manifests.

# Role Breakdown

KubeCon

CloudNativeCon

Europe 2019

The TUF specific roles  
are as follows

- Root: user
- Targets: user
- Snapshot: content-trust\*
- Timestamp: content-trust

# How To Sign

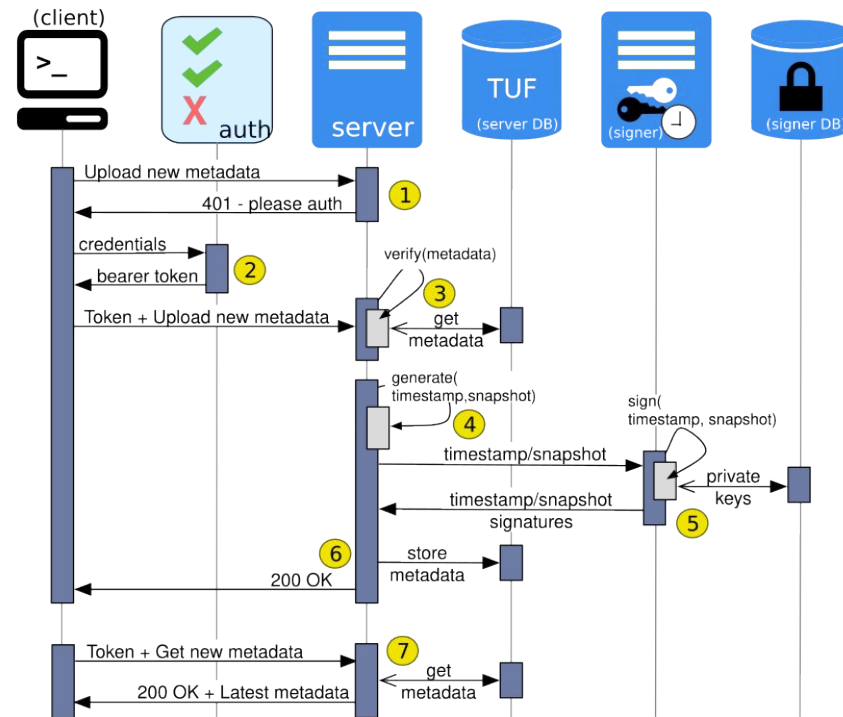

KubeCon

CloudNativeCon

Europe 2019

In order to sign the metadata, the docker cli tool will talk to the content trust server before pushing to the registry.

KubeCon

CloudNativeCon

Europe 2019

# Docker Today

# Key Compromise

KubeCon

CloudNativeCon

Europe 2019

Key compromised	Malicious content	Rollback, freeze, mix and match	Denial of service
Timestamp (online)	No	No	Limited
Snapshot (online*)	No	No	Limited
Targets (offline)	No (*)	No (*)	Limited
Root (offline)	Yes	Yes	Yes

# Key Compromise

KubeCon

CloudNativeCon

## Ma What the hell?

## for

Totally crazy. Someone went to extreme lengths, hacking DNS configuration to intercept a single password reset email (I received all other emails except that specific one), to gain authorization to my GitHub account. Why?

I have two best guesses:

1. They wanted access to my company's private code.
2. They wanted to maliciously modify the Requests codebase (or Certifi, the CA bundle that is shipped with Requests).

downloaded code after February to check that code against a **listing of known good MD5 sums**

service Heroku.

HACKERS WHO BREACHED Google and other

## Functionaries

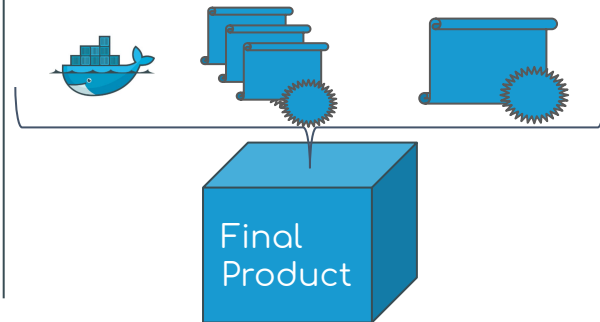

Perform steps, provide evidence

## End User

Verify

# Conclusion

KubeCon

CloudNativeCon

Europe 2019

- Securing software distribution, etc. is hard
  - Use TUF -- standardized, widely used, security audited...
- Docker Content Trust provides strong guarantees for Docker images
- in-toto will further improve security

# TUF Standardization (TAPs)

KubeCon

CloudNativeCon

Europe 2019

- TAP 3 -- multi-role signatures
  - Lets one have 'unequal' quorums
- TAP 4 -- pinning repository keys
  - Control the root of trust for parts of the namespace
  - Root role compromise != game over
- TAP 5 -- specify URLs in root files
  - Makes it easy to change the repo location
- TAP 6 -- version numbers in root metadata
- TAP 7 -- TUF conformance testing

Discuss with us, then submit (TAP 1/2)

# Thank you!
