#### Data Science for Economists

Lecture 5: Data cleaning & wrangling: (1) Tidyverse

Grant McDermott University of Oregon | EC 607

#### Table of contents

#### 1. Prologue

- 2. Tidyverse basics
- 3. Data wrangling with dplyr
  - filter
  - arrange
  - select
  - mutate
  - summarise
  - joins
- 4. Data tidying with tidyr
  - pivot\_longer / pivot\_wider
  - separate
  - unite

#### 5. Summary

### Prologue

### What is "tidy" data?

#### **Resources:**

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

## What is "tidy" data?

#### **Resources:**

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

#### Key points:

- 1. Each variable forms a column.
- 2. Each observation forms a row.
- 3. Each type of observational unit forms a table.

### What is "tidy" data?

#### **Resources:**

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

#### Key points:

- 1. Each variable forms a column.
- 2. Each observation forms a row.
- 3. Each type of observational unit forms a table.

Basically, tidy data is more likely to be long (i.e. narrow) format than wide format.

# Checklist

R packages you'll need today

**☑ tidyverse** 

**☑** nycflights13

## Checklist

#### R packages you'll need today

#### **☑ tidyverse**

#### **☑** nycflights13

I'll hold off loading these libraries for now. But you can install/update them both with the following command.

install.packages(c('tidyverse', 'nycflights13'), repos = 'https://cran.rstudio.com

**Tip:** If you're on Linux, then I *strongly* recommend installing the pre-compiled binary versions of these packages from RSPM instead of CRAN. The exact repo mirror varies by distro (see the link). But on Ubuntu 20.04, for example, you'd use:

install.packages(c('tidyverse', 'nycflights13'), repos = 'https://packagemanager.r

# Tidyverse basics

# Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

### Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

I won't delve into this debate here, because I think the answer is clear: We should teach the tidyverse first (or, at least, early).

- The documentation and community support are outstanding.
- Having a consistent philosophy and syntax makes it easier to learn.
- Provides a convenient "front-end" to big data tools that we'll use later in the course.
- For data cleaning, wrangling, and plotting, the tidyverse really is a no-brainer.<sup>1</sup>

<sup>1</sup> I'm also a huge fan of **data.table**. This package will be the subject of our next lecture.

### Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

I won't delve into this debate here, because I think the answer is clear: We should teach the tidyverse first (or, at least, early).

- The documentation and community support are outstanding.
- Having a consistent philosophy and syntax makes it easier to learn.
- Provides a convenient "front-end" to big data tools that we'll use later in the course.
- For data cleaning, wrangling, and plotting, the tidyverse really is a no-brainer.<sup>1</sup>

But... this certainly shouldn't put you off learning base R alternatives.

- Base R is extremely flexible and powerful (and stable).
- There are some things that you'll have to venture outside of the tidyverse for.
- A combination of tidyverse and base R is often the best solution to a problem.
- Excellent base R data manipulation tutorials: here and here.

<sup>1</sup> I'm also a huge fan of **data.table**. This package will be the subject of our next lecture.

# Tidyverse vs. base R (cont.)

One point of convenience is that there is often a direct correspondence between a tidyverse command and its base R equivalent.

These generally follow a tidyverse::snake\_case VS base::period.case rule. E.g. Compare:

tidyverse	base
<pre>?readr::read_csv</pre>	<pre>?utils::read.csv</pre>
?dplyr::if_else	<pre>?base::ifelse</pre>
<pre>?tibble::tibble</pre>	<pre>?base::data.frame</pre>

Etcetera.

If you call up the above examples, you'll see that the tidyverse alternative typically offers some enhancements or other useful options (and sometimes restrictions) over its base counterpart.

# Tidyverse vs. base R (cont.)

One point of convenience is that there is often a direct correspondence between a tidyverse command and its base R equivalent.

These generally follow a tidyverse::snake\_case VS base::period.case rule. E.g. Compare:

tidyverse	base
<pre>?readr::read_csv</pre>	<pre>?utils::read.csv</pre>
?dplyr::if_else	<pre>?base::ifelse</pre>
<pre>?tibble::tibble</pre>	<pre>?base::data.frame</pre>

Etcetera.

If you call up the above examples, you'll see that the tidyverse alternative typically offers some enhancements or other useful options (and sometimes restrictions) over its base counterpart.

**Remember:** There are (almost) always multiple ways to achieve a single goal in R.

#### Tidyverse packages

Let's load the tidyverse meta-package and check the output.

```
library(tidyverse)
```

#### Tidyverse packages

Let's load the tidyverse meta-package and check the output.

```
library(tidyverse)
```

We see that we have actually loaded a number of packages (which could also be loaded individually): **ggplot2**, **tibble**, **dplyr**, etc.

• We can also see information about the package versions and some namespace conflicts.

# Tidyverse packages (cont.)

The tidyverse actually comes with a lot more packages than those that are just loaded automatically.<sup>1</sup>

```
tidyverse_packages()
```

##	[1]	"broom"	"cli"	"crayon"	"dbplyr"	"dplyr"
##	[6]	"forcats"	"ggplot2"	"haven"	"hms"	"httr"
##	[11]	"jsonlite"	"lubridate"	"magrittr"	"modelr"	"pillar"
##	[16]	"purrr"	"readr"	"readxl"	"reprex"	"rlang"
##	[21]	"rstudioapi"	"rvest"	"stringr"	"tibble"	"tidyr"
##	[26]	"xml2"	"tidyverse"			

We'll use several of these additional packages during the remainder of this course.

- E.g. The **lubridate** package for working with dates and the **rvest** package for webscraping.
- However, bear in mind that these packages will have to be loaded separately.

<sup>1</sup> It also includes a *lot* of dependencies upon installation. This is a matter of some controversy.

# Tidyverse packages (cont.)

I hope to cover most of the tidyverse packages over the length of this course.

Today, however, I'm only really going to focus on two packages:

- 1. dplyr
- 2. **tidyr**

These are the workhorse packages for cleaning and wrangling data. They are thus the ones that you will likely make the most use of (alongside **ggplot2**, which we already met back in Lecture 1).

• Data cleaning and wrangling occupies an inordinate amount of time, no matter where you are in your research career.

#### An aside on pipes: %>%

We already learned about pipes in our lecture on the bash shell. The tidyverse loads its own pipe operator, denoted %>%.

I want to reiterate how cool pipes are, and how using them can dramatically improve the experience of reading and writing code. Compare:

## These next two lines of code do exactly the same thing.
mpg %>% filter(manufacturer="audi") %>% group\_by(model) %>% summarise(hwy\_mean =
summarise(group\_by(filter(mpg, manufacturer="audi"), model), hwy\_mean = mean(hwy)

#### An aside on pipes: %>%

We already learned about pipes in our lecture on the bash shell. The tidyverse loads its own pipe operator, denoted %>%.

I want to reiterate how cool pipes are, and how using them can dramatically improve the experience of reading and writing code. Compare:

## These next two lines of code do exactly the same thing.
mpg %>% filter(manufacturer="audi") %>% group\_by(model) %>% summarise(hwy\_mean =
summarise(group\_by(filter(mpg, manufacturer="audi"), model), hwy\_mean = mean(hwy)

The first line reads from left to right, exactly how I thought of the operations in my head.

• Take this object (mpg), do this (filter), then do this (group\_by), etc.

The second line totally inverts this logical order (the final operation comes first!)

• Who wants to read things inside out?

### An aside on pipes: %>% (cont.)

The piped version of the code is even more readable if we write it over several lines. Here it is again and, this time, I'll run it for good measure so you can see the output:

```
mpg %>%
filter(manufacturer="audi") %>%
group_by(model) %>%
summarise(hwy_mean = mean(hwy))
```

```
## # A tibble: 3 x 2
## model hwy_mean
## <chr> <dbl>
## 1 a4 28.3
## 2 a4 quattro 25.8
## 3 a6 quattro 24
```

Remember: Using vertical space costs nothing and makes for much more readable/writeable code than cramming things horizontally.

### An aside on pipes: %>% (cont.)

The piped version of the code is even more readable if we write it over several lines. Here it is again and, this time, I'll run it for good measure so you can see the output:

```
mpg %>%
filter(manufacturer="audi") %>%
group_by(model) %>%
summarise(hwy_mean = mean(hwy))
```

```
## # A tibble: 3 x 2
## model hwy_mean
## <chr> <dbl>
## 1 a4 28.3
## 2 a4 quattro 25.8
## 3 a6 quattro 24
```

Remember: Using vertical space costs nothing and makes for much more readable/writeable code than cramming things horizontally.

PS — The pipe is originally from the **magrittr** package (geddit?), which can do some other cool things if you're inclined to explore.

# A further aside on the base R pipe: |>

The magrittr pipe has proven so successful and popular, that the R core team recently announced a "native" pipe would be coming to base R, denoted **D**.<sup>1</sup> For example:

```
mtcars \triangleright subset(cyl=4) \triangleright head()
mtcars \triangleright subset(cyl=4) \triangleright d \Rightarrow lm(mpg ~ disp, data = d)
```

<sup>1</sup> That's actually a | followed by a >. The default font on these slides just makes it look extra fancy.

# A further aside on the base R pipe: |>

The magrittr pipe has proven so successful and popular, that the R core team recently announced a "native" pipe would be coming to base R, denoted **D**.<sup>1</sup> For example:

```
mtcars \triangleright subset(cyl=4) \triangleright head()
mtcars \triangleright subset(cyl=4) \triangleright d \Rightarrow lm(mpg ~ disp, data = d)
```

At the time of writing this native pipe is only available in the development version of R. (I'll show an in-class demo.)

This native pipe complements some other new cool features, like support for "lambda" functions in R.

• So, worth watching this space.

<sup>1</sup> That's actually a | followed by a >. The default font on these slides just makes it look extra fancy.

# dplyr

### Aside: dplyr 1.0.0 release

Some of the **dplyr** features that we'll cover today were introduced in version 1.0.0 of the package.

- Version 1.0.0 is a big deal since it marks a stable code base for the package going forward. However, at the time of writing these slides, it had only come out very recently.
- Please make sure that you are running at least **dplyr** 1.0.0 before continuing.

```
packageVersion('dplyr')
```

## [1] '1.0.4'

# install.packages('dplyr') ## install updated version if < 1.0.0</pre>

### Aside: dplyr 1.0.0 release

Some of the **dplyr** features that we'll cover today were introduced in version 1.0.0 of the package.

- Version 1.0.0 is a big deal since it marks a stable code base for the package going forward. However, at the time of writing these slides, it had only come out very recently.
- Please make sure that you are running at least **dplyr** 1.0.0 before continuing.

```
packageVersion('dplyr')
```

```
## [1] '1.0.4'
```

# install.packages('dplyr') ## install updated version if < 1.0.0</pre>

*Note:* **dplyr** 1.0.0 also notifies you about grouping variables every time you do operations on or with them. YMMV, but, personally, I find these messages annoying and so prefer to switch them off.

options(dplyr.summarise.inform = FALSE) ## Add to .Rprofile to make permanent

## Key dplyr verbs

There are five key dplyr verbs that you need to learn.

- 1. filter: Filter (i.e. subset) rows based on their values.
- 2. arrange : Arrange (i.e. reorder) rows based on their values.
- 3. select : Select (i.e. subset) columns by their names:
- 4. mutate: Create new columns.
- 5. summarise: Collapse multiple rows into a single summary value.<sup>1</sup>

summarize with a "z" works too. R doesn't discriminate against uncivilised nations of the world.

## Key dplyr verbs

There are five key dplyr verbs that you need to learn.

- 1. filter: Filter (i.e. subset) rows based on their values.
- 2. arrange : Arrange (i.e. reorder) rows based on their values.
- 3. select : Select (i.e. subset) columns by their names:
- 4. mutate: Create new columns.
- 5. summarise: Collapse multiple rows into a single summary value.<sup>1</sup>

Let's practice these commands together using the starwars data frame that comes prepackaged with dplyr.

<sup>1</sup> summarize with a "z" works too. R doesn't discriminate against uncivilised nations of the world.

# 1) dplyr::filter

We can chain multiple filter commands with the pipe (%>%), or just separate them within a single filter command using commas.

```
starwars %>%
filter(
   species = "Human",
   height ≥ 190
   )
```

```
## # A tibble: 4 x 14
          height mass hair color skin color eye color birth year sex
                                                                   gender
##
    name
    <chr> <int> <dbl> <chr>
                                <chr>
                                          <chr>
                                                        <dbl> <chr> <chr>
##
                                white
                                          yellow
## 1 Dart...
            202
                  136 none

## 3 Shmi... 163 NA black
                              fair
                                                      72 fema... femin...
                                        brown
## # ... with 5 more variables: homeworld <chr>, species <chr>, films <list>,
    vehicles <list>, starships <list>
## #
```

# 1) dplyr::filter cont.

A very common filter use case is identifying (or removing) missing data cases.

starwars %>%
filter(is.na(height))

## # A tibble: 6 x 14 height mass hair color skin color eye color birth year sex ## name gender ## <chr> <int> <dbl> <chr> <chr> <chr> <dbl> <chr> <chr> NA male mascu... ## 1 Arve… NA NA brown fair brown dark ## 2 Finn NA NA black dark NA male mascu... ## 3 Rey light hazel NA fema... femin... NA NA brown light NA male mascu… ## 4 Poe ... NA NA brown brown 5 BB8 NA NA none none black NA none mascu… ## ## 6 Capt... NA NA unknown unknown unknown NA < NA > < NA >## # ... with 5 more variables: homeworld <chr>, species <chr>, films <list>, vehicles <list>, starships <list> ## #

# 1) dplyr::filter cont.

A very common filter use case is identifying (or removing) missing data cases.

starwars %>%
filter(is.na(height))

## # A tibble: 6 x 14 height mass hair color skin color eye color birth year sex ## name gender ## <chr> <int> <dbl> <chr> <chr> <chr> <dbl> <chr> <chr> NA male mascu... ## 1 Arve… NA NA brown fair brown dark ## 2 Finn NA NA black dark NA male mascu... light hazel NA fema... femin... ## 3 Rey NA NA brown light NA male mascu… ## 4 Poe ... NA NA brown brown ## 5 BB8 NA NA none none black NA none mascu… NA NA unknown ## 6 Capt... unknown unknown NA <NA> <NA> ## # ... with 5 more variables: homeworld <chr>, species <chr>, films <list>, vehicles <list>, starships <list> ## #

To remove missing observations, simply use negation: filter(!is.na(height)). Try this
yourself.

# 2) dplyr::arrange

starwars %>%
arrange(birth\_year)

## # A tibble: 87 x 14

##		name	height	mass	hair_color	skin_color	eye_color	birth_year	sex	gender
##		<chr></chr>	<int></int>	<dbl></dbl>	<chr></chr>	<chr></chr>	<chr></chr>	<dbl></dbl>	<chr></chr>	<chr></chr>
##	1	Wick…	88	20	brown	brown	brown	8	male	mascu…
##	2	IG-88	200	140	none	metal	red	15	none	mascu…
##	3	Luke…	172	77	blond	fair	blue	19	male	mascu…
##	4	Leia…	150	49	brown	light	brown	19	fema	femin…
##	5	Wedg…	170	77	brown	fair	hazel	21	male	mascu…
##	6	Plo	188	80	none	orange	black	22	male	mascu…
##	7	Bigg…	183	84	black	light	brown	24	male	mascu…
##	8	Han …	180	80	brown	fair	brown	29	male	mascu…
##	9	Land	177	79	black	dark	brown	31	male	mascu…
##	10	Boba	183	78.2	black	fair	brown	31.5	male	mascu…
## # with 77 more rows, and 5 more variables: homeworld <chr>, species <chr>,</chr></chr>										
## # films <list>, vehicles <list>, starships <list></list></list></list>										

# 2) dplyr::arrange

starwars %>%
arrange(birth\_year)

## # A tibble: 87 x 14 height mass hair color skin color eye color birth year sex ## gender name ## <chr> <int> <dbl> <chr> <chr> <chr> <dbl> <chr> <chr> ## 1 Wick… 88 20 brown brown brown 8 male mascu… 2 IG-88 200 140 metal red ## none 15 none mascu… 3 Luke… blond fair blue male 172 77 19 ## mascu… light fema… femin… ## 4 Leia… 150 49 brown brown 19 5 Wedg... 170 77 brown fair hazel 21 male ## mascu… 6 Plo ... ## 188 80 none orange black 22 male mascu… 7 Bigg… light 183 black brown male ## 84 24 mascu… ## 8 Han ... 180 80 brown fair brown 29 male mascu… ## 9 Land... 177 79 black dark brown 31 male mascu… 10 Boba... 183 78.2 black fair brown 31.5 male ## mascu… # ... with 77 more rows, and 5 more variables: homeworld <chr>, species <chr>, ## ## # films <list>, vehicles <list>, starships <list>

*Note:* Arranging on a character-based column (i.e. strings) will sort alphabetically. Try this yourself by arranging according to the "name" column.

# 2) dplyr::arrange cont.

We can also arrange items in descending order using arrange(desc()).

```
starwars %>%
arrange(desc(birth_year))
```

```
## # A tibble: 87 x 14
```

##		name	height	mass	hair_color	skin_color	eye_color	birth_year	sex	gender
##		<chr></chr>	<int></int>	<dbl></dbl>	<chr></chr>	<chr></chr>	<chr></chr>	<dbl></dbl>	<chr></chr>	<chr></chr>
##	1	Yoda	66	17	white	green	brown	896	male	mascu
##	2	Jabb	175	1358	<na></na>	green-tan…	orange	600	herm…	mascu…
##	3	Chew	228	112	brown	unknown	blue	200	male	mascu…
##	4	C-3P0	167	75	<na></na>	gold	yellow	112	none	mascu
##	5	Dooku	193	80	white	fair	brown	102	male	mascu
##	6	Qui	193	89	brown	fair	blue	92	male	mascu
##	7	Ki-A	198	82	white	pale	yellow	92	male	mascu
##	8	Fini…	170	NA	blond	fair	blue	91	male	mascu
##	9	Palp…	170	75	grey	pale	yellow	82	male	mascu
##	10	Clie…	183	NA	brown	fair	blue	82	male	mascu
##	# .	… with	77 more	e rows,	, and 5 more	e variables	: homeworld	d <chr>, sp</chr>	ecies	<chr>,</chr>
##	## # films <list>, vehicles <list>, starships <list></list></list></list>									

# 3) dplyr::select

Use commas to select multiple columns out of a data frame. (You can also use "first:last" for consecutive columns). Deselect a column with "-".

starwars %>%
select(name:skin\_color, species, -height)

```
## # A tibble: 87 x 5
```

##		name	mass	hair_color	skin_color	species
##		<chr></chr>	<dbl></dbl>	<chr></chr>	<chr></chr>	<chr></chr>
##	1	Luke Skywalker	77	blond	fair	Human
##	2	C-3P0	75	<na></na>	gold	Droid
##	3	R2-D2	32	<na></na>	white, blue	Droid
##	4	Darth Vader	136	none	white	Human
##	5	Leia Organa	49	brown	light	Human
##	6	Owen Lars	120	brown, grey	light	Human
##	7	Beru Whitesun lars	75	brown	light	Human
##	8	R5-D4	32	<na></na>	white, red	Droid
##	9	Biggs Darklighter	84	black	light	Human

##
  9 Biggs Darklighter Tatooine masculine
##
## 10 Obi-Wan Kenobi Stewjon masculine
## # ... with 77 more rows
```

If you just want to rename columns without subsetting them, you can use rename. Try this now by replacing select(...) in the above code chunk with rename(...).

The select(contains(PATTERN)) option provides a nice shortcut in relevant cases.

```
starwars %>%
select(name, contains("color"))
```

```
## # A tibble: 87 x 4
```

##		name	hair_color	skin_color	eye_color
##		<chr></chr>	<chr></chr>	<chr></chr>	<chr></chr>
##	1	Luke Skywalker	blond	fair	blue
##	2	C-3P0	<na></na>	gold	yellow
##	3	R2-D2	<na></na>	white, blue	red
##	4	Darth Vader	none	white	yellow
##	5	Leia Organa	brown	light	brown
##	6	Owen Lars	brown, grey	light	blue
##	7	Beru Whitesun lars	brown	light	blue
##	8	R5-D4	<na></na>	white, red	red
##	9	Biggs Darklighter	black	light	brown
##	10	Obi-Wan Kenobi	auburn, white	fair	blue-gray
##	# .	. with 77 more rows			

The select(..., everything()) option is another useful shortcut if you only want to bring some variable(s) to the "front" of a data frame.

```
starwars %>%
select(species, homeworld, everything()) %>%
head(5)
```

```
## # A tibble: 5 x 14
```

##	species	homeworld	name	height	mass	hair_color	skin_color	eye_color
##	<chr></chr>	<chr></chr>	<chr></chr>	<int></int>	<dbl></dbl>	<chr></chr>	<chr></chr>	<chr></chr>
## 1	Human	Tatooine	Luke	172	77	blond	fair	blue
## 2	Droid	Tatooine	C-3P0	167	75	<na></na>	gold	yellow
## 3	Droid	Naboo	R2-D2	96	32	<na></na>	white, bl…	red
## 4	Human	Tatooine	Dart…	202	136	none	white	yellow
## 5	Human	Alderaan	Leia…	150	49	brown	light	brown
## #	with 6	6 more var	iables:	birth_	year <	dbl>, sex ·	<chr>, gende</chr>	er <chr>,</chr>
## #	films	<list>, ve</list>	ehicles	s <list></list>	, star	ships <lis< td=""><td>t&gt;</td><td></td></lis<>	t>	

The select(..., everything()) option is another useful shortcut if you only want to bring some variable(s) to the "front" of a data frame.

```
starwars %>%
select(species, homeworld, everything()) %>%
head(5)
```

```
## # A tibble: 5 x 14
##
            species homeworld name height mass hair color skin color eye color
                   <chr> <chr< <chr> <chr> <chr> <chr< <
                                                                                                                                                                                                                                                               <chr>
##

## 3 Droid
## 4 Human Tatooine Dart… 202 136 none white
                                                                                                                                                                                                                                                               vellow
## 5 Human Alderaan Leia... 150 49 brown light
                                                                                                                                                                                                                                                                 brown
## # ... with 6 more variables: birth year <dbl>, sex <chr>, gender <chr>,
## # films <list>, vehicles <list>, starships <list>
```

*Note:* The new relocate function available in dplyr 1.0.0 has brought a lot more functionality to ordering of columns. See here.

## 4) dplyr::mutate

You can create new columns from scratch, or (more commonly) as transformations of existing columns.

```
starwars %>%
select(name, birth_year) %>%
mutate(dog_years = birth_year * 7) %>%
mutate(comment = paste0(name, " is ", dog_years, " in dog years."))
```

```
## # A tibble: 87 x 4
```

##	name	birth_year	dog_years	comment
##	<chr></chr>	<dbl></dbl>	<dbl></dbl>	<chr></chr>
##	1 Luke Skywalker	19	133	Luke Skywalker is 133 in dog years.
##	2 C-3PO	112	784	C-3PO is 784 in dog years.
##	3 R2-D2	33	231	R2-D2 is 231 in dog years.
##	4 Darth Vader	41.9	293.	Darth Vader is 293.3 in dog years.
##	5 Leia Organa	19	133	Leia Organa is 133 in dog years.
##	6 Owen Lars	52	364	Owen Lars is 364 in dog years.
##	7 Beru Whitesun lars	47	329	Beru Whitesun lars is 329 in dog yea…
##	8 R5-D4	NA	NA	R5-D4 is NA in dog years.
##	9 Biggs Darklighter	24	168	Biggs Darklighter is 168 in dog year…
##	10 Obi-Wan Kenobi	57	399	Obi-Wan Kenobi is 399 in dog years.
##	# with 77 more rows			

*Note:* mutate is order aware. So you can chain multiple mutates in a single call.

```
starwars %>%
select(name, birth_year) %>%
mutate(
    dog_years = birth_year * 7, ## Separate with a comma
    comment = paste0(name, " is ", dog_years, " in dog years.")
    )
```

## # A tibble: 87 x 4								
## name	birth_year	dog_years	comment					
## <chr></chr>	<dbl></dbl>	<dbl></dbl>	<chr></chr>					
## 1 Luke Skywalker	19	133	Luke Skywalker is 133 in dog years.					
## 2 C-3PO	112	784	C-3PO is 784 in dog years.					
## 3 R2-D2	33	231	R2-D2 is 231 in dog years.					
## 4 Darth Vader	41.9	293.	Darth Vader is 293.3 in dog years.					
## 5 Leia Organa	19	133	Leia Organa is 133 in dog years.					
## 6 Owen Lars	52	364	Owen Lars is 364 in dog years.					
## 7 Beru Whitesun lars	47	329	Beru Whitesun lars is 329 in dog yea…					
## 8 R5-D4	NA	NA	R5-D4 is NA in dog years.					
## 9 Biggs Darklighter	24	168	Biggs Darklighter is 168 in dog year…					
## 10 Obi-Wan Kenobi	57	399	Obi-Wan Kenobi is 399 in dog years.					
## # with 77 more rows			28 / 55					

Boolean, logical and conditional operators all work well with mutate too.

```
starwars %>%
select(name, height) %>%
filter(name %in% c("Luke Skywalker", "Anakin Skywalker")) %>%
mutate(tall1 = height > 180) %>%
mutate(tall2 = ifelse(height > 180, "Tall", "Short")) ## Same effect, but can ch
```

##	#	A tibble: 2 x 4			
##		name	height	tall1	tall2
##		<chr></chr>	<int></int>	<lgl></lgl>	<chr></chr>
##	1	Luke Skywalker	172	FALSE	Short
##	2	Anakin Skywalker	188	TRUE	Tall

Lastly, combining mutate with the new across feature in dplyr 1.0.0+ allows you to easily work on a subset of variables. For example:

```
starwars %>%
select(name:eye_color) %>%
mutate(across(where(is.character), toupper)) %>%
head(5)
```

```
## # A tibble: 5 x 6
```

##	name	height	mass	hair_color	skin_color	eye_color
##	<chr></chr>	<int></int>	<dbl></dbl>	<chr></chr>	<chr></chr>	<chr></chr>
## 1	LUKE SKYWALKER	172	77	BLOND	FAIR	BLUE
## 2	C-3P0	167	75	<na></na>	GOLD	YELLOW
## 3	R2-D2	96	32	<na></na>	WHITE, BLUE	RED
## 4	DARTH VADER	202	136	NONE	WHITE	YELLOW
## 5	LEIA ORGANA	150	49	BROWN	LIGHT	BROWN

Lastly, combining mutate with the new across feature in dplyr 1.0.0+ allows you to easily work on a subset of variables. For example:

```
starwars %>%
select(name:eye_color) %>%
mutate(across(where(is.character), toupper)) %>%
head(5)
```

```
## # A tibble: 5 x 6
                       mass hair color skin color
##
    name
                 height
                                                 eve color
    <chr> <int> <dbl> <chr>
                                      <chr>
                                                 <chr>
##
## 1 LUKE SKYWALKER
                    172 77 BLOND
                                      FAIR
                                                 BLUE
## 2 C-3PO
                    167 75 <NA>
                                      GOLD YELLOW
## 3 R2-D2
                   96
                       32 <NA>
                                      WHITE, BLUE RED
## 4 DARTH VADER
                    202
                       136 NONE
                                      WHITE
                                                YELLOW
## 5 LEIA ORGANA
                    150
                          49 BROWN
                                      LIGHT
                                                 BROWN
```

*Note:* This workflow (i.e. combining mutate and across) supersedes the old "scoped" variants of mutate that you might have used previously. More details here and here.

# 5) dplyr::summarise

Particularly useful in combination with the group\_by command.

```
starwars %>%
  group by(species, gender) %>%
  summarise(mean height = mean(height, na.rm = TRUE))
## # A tibble: 42 x 3
## # Groups: species [38]
     species gender mean_height
##
   <chr> <chr>
                              <dbl>
##
   1 Aleena masculine
                                79
##
  2 Besalisk masculine
                               198
##
##
   3 Cerean
              masculine
                               198
   4 Chagrian masculine
##
                               196
   5 Clawdite feminine
                               168
##
   6 Droid feminine
                               96
##
   7 Droid
              masculine
##
                               140
   8 Dug
              masculine
                               112
##
   9 Ewok masculine
                               88
##
## 10 Geonosian masculine
                               183
## # ... with 32 more rows
```

# 5) dplyr::summarise cont.

Note that including "na.rm = TRUE" (or, its alias "na.rm = T") is usually a good idea with summarise functions. Otherwise, any missing value will propogate to the summarised value too.

```
## Probably not what we want
starwars %>%
   summarise(mean_height = mean(height))
```

```
## # A tibble: 1 x 1
## mean_height
## <dbl>
## 1 NA
```

```
## Much better
starwars %>%
summarise(mean_height = mean(height, na.rm = TRUE))
```

```
## # A tibble: 1 x 1
## mean_height
## <dbl>
## 1 174.
```

# 5) dplyr::summarise cont.

The same across -based workflow that we saw with mutate a few slides back also works with summarise. For example:

```
starwars %>%
group_by(species) %>%
summarise(across(where(is.numeric), mean, na.rm=T)) %>%
head(5)
```

```
## # A tibble: 5 x 4
    species height mass birth year
##
    <chr> <dbl> <dbl>
                               <dbl>
##
  1 Aleena 79
                       15
                                NaN
###
## 2 Besalisk
                198
                      102
                                NaN
## 3 Cerean
                198 82
                                92
## 4 Chagrian
               196
                      NaN
                                NaN
  5 Clawdite
##
                168
                       55
                                NaN
```

# 5) dplyr::summarise cont.

The same across -based workflow that we saw with mutate a few slides back also works with summarise. For example:

```
starwars %>%
group_by(species) %>%
summarise(across(where(is.numeric), mean, na.rm=T)) %>%
head(5)
```

```
## # A tibble: 5 x 4
    species height mass birth_year
##
    <chr> <dbl> <dbl>
                              <dbl>
##
## 1 Aleena 79
                      15
                               NaN
## 2 Besalisk
               198
                     102
                               NaN
## 3 Cerean
               198 82
                               92
## 4 Chagrian 196
                     NaN
                               NaN
## 5 Clawdite
               168
                      55
                               NaN
```

*Note:* Again, this functionality supersedes the old "scoped" variants of summarise that you used prior to dplyr 1.0.0. Details here and here.

group\_by and ungroup: For (un)grouping.

• Particularly useful with the summarise and mutate commands, as we've already seen.

group\_by and ungroup: For (un)grouping.

• Particularly useful with the summarise and mutate commands, as we've already seen.

slice: Subset rows by position rather than filtering by values.

• E.g. starwars %>% slice(c(1, 5))

group\_by and ungroup: For (un)grouping.

• Particularly useful with the summarise and mutate commands, as we've already seen.

slice: Subset rows by position rather than filtering by values.

• E.g. starwars %>% slice(c(1, 5))

pull: Extract a column from as a data frame as a vector or scalar.

• E.g. starwars %>% filter(gender="female") %>% pull(height)

group\_by and ungroup: For (un)grouping.

• Particularly useful with the summarise and mutate commands, as we've already seen.

slice: Subset rows by position rather than filtering by values.

• E.g. starwars %>% slice(c(1, 5))

pull: Extract a column from as a data frame as a vector or scalar.

• E.g. starwars %>% filter(gender="female") %>% pull(height)

count and distinct: Number and isolate unique observations.

- E.g. starwars %>% count(species), Or starwars %>% distinct(species)
- You could also use a combination of mutate, group\_by, and n(), e.g. starwars %>% group\_by(species) %>% mutate(num = n()).

# Other dplyr goodies (cont.)

There are also a whole class of window functions for getting leads and lags, ranking, creating cumulative aggregates, etc.

• See vignette("window-functions").

# Other dplyr goodies (cont.)

There are also a whole class of window functions for getting leads and lags, ranking, creating cumulative aggregates, etc.

• See vignette("window-functions").

The final set of dplyr "goodies" are the family of join operations. However, these are important enough that I want to go over some concepts in a bit more depth...

• We will encounter and practice these many more times as the course progresses.

# Joins

One of the mainstays of the dplyr package is merging data with the family join operations.

- inner\_join(df1, df2)
- left\_join(df1, df2)
- right\_join(df1, df2)
- full\_join(df1, df2)
- semi\_join(df1, df2)
- anti\_join(df1, df2)

(You find find it helpful to to see visual depictions of the different join operations here.)

# Joins

One of the mainstays of the dplyr package is merging data with the family join operations.

- right\_join(df1, df2)
- full\_join(df1, df2)
- semi\_join(df1, df2)
- anti\_join(df1, df2)

(You find find it helpful to to see visual depictions of the different join operations here.)

For the simple examples that I'm going to show here, we'll need some data sets that come bundled with the **nycflights13** package.

• Load it now and then inspect these data frames in your own console.

**library**(nycflights13) flights planes

Let's perform a left join on the flights and planes datasets.

• *Note*: I'm going subset columns after the join, but only to keep text on the slide.

Let's perform a left join on the flights and planes datasets.

• Note: I'm going subset columns after the join, but only to keep text on the slide.

```
left join(flights, planes) %>%
  select(year, month, day, dep time, arr time, carrier, flight, tailnum, type, mod
## Joining, by = c("year", "tailnum")
## # A tibble: 336,776 x 10
      vear month
                   day dep time arr time carrier flight tailnum type
                                                                      model
##

```

## # ... with 336,766 more rows

#### (continued from previous slide)

Note that dplyr made a reasonable guess about which columns to join on (i.e. columns that share the same name). It also told us its choices:

```
## Joining, by = c("year", "tailnum")
```

However, there's an obvious problem here: the variable "year" does not have a consistent meaning across our joining datasets!

• In one it refers to the year of flight, in the other it refers to year of construction.

#### (continued from previous slide)

Note that dplyr made a reasonable guess about which columns to join on (i.e. columns that share the same name). It also told us its choices:

## Joining, by = c("year", "tailnum")

However, there's an obvious problem here: the variable "year" does not have a consistent meaning across our joining datasets!

• In one it refers to the year of flight, in the other it refers to year of construction.

Luckily, there's an easy way to avoid this problem.

- See if you can figure it out before turning to the next slide.
- Try ?dplyr::join.

(continued from previous slide)

You just need to be more explicit in your join call by using the by = argument.

• You can also rename any ambiguous columns to avoid confusion.

```
left_join(
  flights,
  planes %>% rename(year_built = year), ## Not necessary w/ below line, but helpfu
  by = "tailnum" ## Be specific about the joining column
  ) %>%
  select(year, month, day, dep_time, arr_time, carrier, flight, tailnum, year_buil
  head(3) ## Just to save vertical space on the slide
```

```
## # A tibble: 3 x 11
   year month day dep time arr time carrier flight tailnum year built type

```

Make sure you know what "year.x" and "year.y" are. Again, it pays to be specific.

# tidyr

#### Key tidyr verbs

- 1. pivot\_longer: Pivot wide data into long format (i.e. "melt").<sup>1</sup>
- 2. pivot\_wider: Pivot long data into wide format (i.e. "cast").<sup>2</sup>
- 3. separate : Separate (i.e. split) one column into multiple columns.
- 4. unite: Unite (i.e. combine) multiple columns into one.

<sup>1</sup> Updated version of tidyr :: gather.

<sup>2</sup> Updated version of tidyr::spread.

#### Key tidyr verbs

- 1. pivot\_longer: Pivot wide data into long format (i.e. "melt").<sup>1</sup>
- 2. pivot\_wider: Pivot long data into wide format (i.e. "cast").<sup>2</sup>
- 3. separate : Separate (i.e. split) one column into multiple columns.
- 4. unite: Unite (i.e. combine) multiple columns into one.

Let's practice these verbs together in class.

• Side question: Which of pivot\_longer VS pivot\_wider produces "tidy" data?

<sup>1</sup> Updated version of tidyr::gather.

<sup>2</sup> Updated version of tidyr::spread.

#### 1) tidyr::pivot\_longer

```
stocks = data.frame( ## Could use "tibble" instead of "data.frame" if you prefer
time = as.Date('2009-01-01') + 0:1,
X = rnorm(2, 0, 1),
Y = rnorm(2, 0, 2),
Z = rnorm(2, 0, 4)
)
stocks
```

##timeXYZ##12009-01-010.7630456-0.7002949-3.417682##22009-01-02-0.4579186-0.7498116-6.052036

```
stocks %>% pivot_longer(-time, names_to="stock", values_to="price")
```

```
## # A tibble: 6 x 3
## time stock price
## <date> <chr> <dbl>
## 1 2009-01-01 X 0.763
## 2 2009-01-01 Y -0.700
## 3 2009-01-01 Z -3.42
## 4 2009-01-02 X -0.458
## 5 2009-01-02 Y -0.750
## 6 2009-01-02 Z -6.05
```

## 1) tidyr::pivot\_longer *cont*.

Let's quickly save the "tidy" (i.e. long) stocks data frame for use on the next slide.

```
## Write out the argument names this time: i.e. "names_to=" and "values_to="
tidy_stocks =
   stocks %>%
   pivot_longer(-time, names_to="stock", values_to="price")
```

#### 2) tidyr::pivot\_wider

tidy\_stocks %>% pivot\_wider(names\_from=stock, values\_from=price)

## # A tibble: 2 x 4
## time X Y Z
## <date> <dbl> <dbl> <dbl> <dbl>
## 1 2009-01-01 0.763 -0.700 -3.42
## 2 2009-01-02 -0.458 -0.750 -6.05

tidy\_stocks %>% pivot\_wider(names\_from=time, values\_from=price)

##	#	A tibb	le: 3 x 3		
##		stock	2009-01-01	<mark>2009-01-0</mark> 2	2
##		<chr></chr>	<dbl< td=""><td>&gt; &lt;</td><td>dbl&gt;</td></dbl<>	> <	dbl>
##	1	Х	0.76	-0	.458
##	2	Υ	-0.70	00 -0	.750
##	3	Z	-3.42	-6	.05

#### 2) tidyr::pivot\_wider

tidy\_stocks %>% pivot\_wider(names\_from=stock, values\_from=price)

## # A tibble: 2 x 4
## time X Y Z
## <date> <dbl> <dbl> <dbl> <dbl>
## 1 2009-01-01 0.763 -0.700 -3.42
## 2 2009-01-02 -0.458 -0.750 -6.05

tidy\_stocks %>% pivot\_wider(names\_from=time, values\_from=price)

```
## # A tibble: 3 x 3
## stock 2009-01-01 2009-01-02
## <chr> <dbl> <dbl> <dbl> <dbl>
## 1 X 0.763 -0.458
## 2 Y -0.700 -0.750
## 3 Z -3.42 -6.05
```

Note that the second example — which has combined different pivoting arguments — has effectively transposed the data.

#### Aside: Remembering the pivot\_\* syntax

There's a long-running joke about no-one being able to remember Stata's "reshape" command. (Exhibit A.)

It's easy to see this happening with the pivot\_\* functions too. However, I find that I never forget the commands as long as I remember the argument order is "names" then "values".

#### 3) tidyr::separate

```
economists = data.frame(name = c("Adam.Smith", "Paul.Samuelson", "Milton.Friedman"
economists
```

## name
## 1 Adam.Smith
## 2 Paul.Samuelson
## 3 Milton.Friedman

economists %>% separate(name, c("first\_name", "last\_name"))

##		first_name	last_name
##	1	Adam	Smith
##	2	Paul	Samuelson
##	3	Milton	Friedman

#### 3) tidyr::separate

```
economists = data.frame(name = c("Adam.Smith", "Paul.Samuelson", "Milton.Friedman"
economists
```

## name
## 1 Adam.Smith
## 2 Paul.Samuelson
## 3 Milton.Friedman

```
economists %>% separate(name, c("first_name", "last_name"))
```

##		first_name	last_name
##	1	Adam	Smith
##	2	Paul	Samuelson
##	3	Milton	Friedman

This command is pretty smart. But to avoid ambiguity, you can also specify the separation character with separate( ..., sep=".").

# 3) tidyr::separate cont.

A related function is separate\_rows, for splitting up cells that contain multiple fields or observations (a frustratingly common occurrence with survey data).

```
jobs = data.frame(
   name = c("Jack", "Jill"),
   occupation = c("Homemaker", "Philosopher, Philanthropist, Troublemaker")
   )
jobs
```

##		name			occupation
##	1	Jack			Homemaker
##	2	Jill	Philosopher,	Philanthropist,	Troublemaker

```
## Now split out Jill's various occupations into different rows
jobs %>% separate_rows(occupation)
```

```
## # A tibble: 4 x 2
## name occupation
## <chr> <chr>
## 1 Jack Homemaker
## 2 Jill Philosopher
```

```
## 3 Jill Philanthropist
```

# 4) tidyr::unite

```
gdp = data.frame(
    yr = rep(2016, times = 4),
    mnth = rep(1, times = 4),
    dy = 1:4,
    gdp = rnorm(4, mean = 100, sd = 2)
    )
gdp
```

##		уr	mnth	dу	gdp
##	1	2016	1	1	101.6175
##	2	2016	1	2	100.4228
##	3	2016	1	3	102.3959
##	4	2016	1	4	101.8645

## Combine "yr", "mnth", and "dy" into one "date" column
gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-")

## date gdp
## 1 2016-1-1 101.6175
## 2 2016-1-2 100.4228
## 3 2016-1-3 102.3959
## 4 2016-1-4 101.8645

## 4) tidyr::unite cont.

Note that unite will automatically create a character variable. You can see this better if we convert it to a tibble.

```
gdp_u = gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-") %>% as_tibble()
gdp_u
## # A tibble: 4 x 2
## date gdp
## <chr> <dbl>
## 1 2016-1-1 102.
## 2 2016-1-2 100.
## 3 2016-1-3 102.
## 4 2016-1-4 102.
```

# 4) tidyr::unite cont.

Note that unite will automatically create a character variable. You can see this better if we convert it to a tibble.

gdp\_u = gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-") %>% as\_tibble()
gdp\_u

## # A tibble: 4 x 2
## date gdp
## <chr> <dbl>
## 1 2016-1-1 102.
## 2 2016-1-2 100.
## 3 2016-1-3 102.
## 4 2016-1-4 102.

If you want to convert it to something else (e.g. date or numeric) then you will need to modify it using mutate. See the next slide for an example, using the lubridate package's super helpful date conversion functions.

# 4) tidyr::unite cont.

(continued from previous slide)

```
library(lubridate)
gdp_u %>% mutate(date = ymd(date))
## # A tibble: 4 x 2
## date gdp
## <date> <dbl>
## 1 2016-01-01 98.5
## 2 2016-01-02 102.
## 3 2016-01-03 101.
## 4 2016-01-04 101.
```

#### Other tidyr goodies

Use crossing to get the full combination of a group of variables.<sup>1</sup>

```
crossing(side=c("left", "right"), height=c("top", "bottom"))
```

```
## # A tibble: 4 x 2
## side height
## <chr> <chr> <chr> 
## 1 left bottom
## 2 left top
## 3 right bottom
## 4 right top
```

<sup>1</sup> Base R alternative: expand.grid.

#### Other tidyr goodies

Use crossing to get the full combination of a group of variables.<sup>1</sup>

```
crossing(side=c("left", "right"), height=c("top", "bottom"))
```

```
## # A tibble: 4 x 2
## side height
## <chr> <chr> <chr> 
## 1 left bottom
## 2 left top
## 3 right bottom
## 4 right top
```

See ?expand and ?complete for more specialised functions that allow you to fill in (implicit) missing data or variable combinations in existing data frames.

• You'll encounter this during your next assignment.

<sup>1</sup> Base R alternative: expand.grid.

#### Summary

#### Key verbs

#### dplyr

- 1. filter
- 2. arrange
- 3. select
- 4. mutate
- 5. summarise

#### tidyr

- 1. pivot\_longer
- 2. pivot\_wider
- 3. separate
- 4. unite

#### Key verbs

#### dplyr

- 1. filter
- 2. arrange
- 3. select
- 4. mutate
- 5. summarise

#### tidyr

- 1. pivot\_longer
- 2. pivot\_wider
- 3. separate
- 4. unite

Other useful items include: pipes (%>%), grouping (group\_by), joining functions (left\_join, inner\_join, etc.).
